ACKNOWLEDGEMENT

I express my sincere gratitude to RK NEXORA, RKNEXORA PRIVATE LIMITED, _____ (College Name), my faculty mentors and the internship supervisor, _____, for their guidance and support. The structured activities, learning resources and regular feedback helped me complete this internship in Agri Entrepreneurship successfully.

I am thankful to the Head of the Department and the college mentor for their encouragement and for guiding me in preparing this report. I am also grateful to the management of RKNEXORA PRIVATE LIMITED for providing a professional learning environment and the opportunity to learn and apply my knowledge in a practical setting. The concept sessions, hands-on tasks with sample formats and templates, and the supervisor's patient and detailed feedback helped me understand how an agri venture is planned and launched behind the scenes.

Finally, I thank my family and peers for their constant encouragement throughout the programme.

PREFACE

Internships are an important part of the undergraduate programme, as they allow students to see how classroom learning is applied in real organisations. The Four-Year Undergraduate Programme (FYUGP), introduced in line with the National Education Policy 2020, gives special importance to experiential learning, skill development and employability. This report has been prepared as part of the internship requirement of Magadh University and the Higher Education guidelines applicable in Bihar.

The report describes the internship undertaken in Agri Entrepreneurship at RKNEXORA PRIVATE LIMITED, the plan followed, the work carried out, and the learning gained. Agriculture gives livelihood to a large part of India's population, but farming alone often gives a limited income because of small landholdings, weather risk and low prices at harvest. Agri entrepreneurship offers another path: starting a business in production, processing, services, supply or marketing that creates value from farm resources and gives work to others. Bihar has many natural advantages, such as fertile land, water, makhana, litchi, mango, vegetables, fish and dairy, and young people who can turn them into successful ventures with the right idea, planning and support. This internship offered a first-hand introduction to that journey.

The report has been arranged in the order suggested by the University, beginning with the cover page and acknowledgement and ending with the conclusion and attendance sheet. It is hoped that the report gives a clear and honest account of the internship experience. All examples in it use dummy data and fictitious names; no real farmer or business information was handled.

EXECUTIVE SUMMARY

This report documents the internship completed in Agri Entrepreneurship at RKNEXORA PRIVATE LIMITED (RK NEXORA - 'Campus to Career'). The programme required a minimum of 120 hours, completed over about four to five weeks (28 working days) with daily sessions of four to five hours, and was supported by an attendance log, supervisor guidance and review.

Background. An agri entrepreneur, sometimes called an agripreneur, is a person who starts and runs a business connected with agriculture and allied activities, such as crop and horticulture production, dairy, poultry, fisheries, mushroom and beekeeping, food processing, farm services, input supply, agri-technology or marketing. Such ventures create income, jobs and value in rural areas. But a good idea alone is not enough: the entrepreneur must study the market, plan the business, estimate costs and profit, arrange money and permissions, manage risks and launch the product with care. For a student from any discipline, the internship shows how creativity, planning, finance, marketing and government support work together in starting an agri business.

Objectives. The internship aimed to (i) build a structured understanding of the agri startup ecosystem and how business ideas are generated, (ii) learn to study market opportunity and prepare a business plan, (iii) learn about government schemes, funding and subsidies for agri ventures, (iv) learn cost and profit estimation and value addition, (v) learn risk management and product launch planning, and (vi) develop communication, documentation and professional discipline.

Work carried out. The student first studied the agri startup ecosystem and business idea generation, then worked through market opportunity study, business plan preparation, government schemes for agri, cost and profit estimation, value addition and processing, funding and subsidies, risk management and product launch planning. Each topic had a concept session followed by a hands-on task using sample formats, templates and dummy data. The later part of the programme was devoted to a case study, a mock practical exercise, supervisor review and preparation of this report.

Project. The work was tied together in a project titled *Agri Startup Business Plan*, in which a business plan with cost-profit estimation, scheme mapping and launch strategy was developed for a sample agri venture.

Method. A blended method was followed - learn, practise, document and review - supported by a daily attendance log with day-wise remarks and regular feedback from the supervisor.

Learning gained. The student gained a clear understanding of how an agri venture is conceived and planned, practical familiarity with idea screening, market study, cost, break-even and profit calculation in MS Excel, scheme and funding mapping, risk matrices and launch timelines, awareness of key registrations and government support, and improved communication, creativity and professional discipline.

Key observations. Many agri ventures fail not because the product is poor but because no one has checked the market or the numbers; value addition and branding can raise income from the same raw material; government schemes help but need proper documents and patience; and a business that plans for risks survives bad years.

Conclusion. The internship met its objectives and contributed to the student's academic understanding, employability and confidence. The report follows the University's suggestive format: cover page, acknowledgement, certificate, contents, preface, executive summary, about the agency, plan and execution, learning outcome, conclusion and attendance sheet.

ABOUT THE AGENCY

RK NEXORA, a unit of RKNEXORA PRIVATE LIMITED, provides structured internship and skill-development programmes under the theme 'Campus to Career'. The organization focuses on academic-industry alignment, practical exposure, assessment, documentation and employability-oriented learning.

Particulars	Details
Name of Agency	RKNEXORA PRIVATE LIMITED
Programme / Unit	RK NEXORA - Campus to Career
Registered Office	C/O Mukesh Kumar, Khiri, PS Atri, Jethiyan, Atri, Gaya - 805236, Bihar, India
CIN	U85499BR2026PTC086757
Email	rknexorapvtltd@gmail.com
Website	www.rknexora.org
Internship Topic	Agri Entrepreneurship

1. Vision

To support students in developing practical, professional and industry-relevant capabilities.

2. Mission

To deliver structured learning experiences that connect academic knowledge with workplace expectations.

3. Activities of the Agency

1. Structured internship programmes aligned with university and higher-education requirements.
2. Skill-development learning modules, practical activities and assignments.
3. Attendance tracking, supervision, assessment and documentation.
4. Employability-oriented guidance connecting campus learning to career readiness.

4. Programme Structure

The internship programme is organised around a fixed number of learning hours, completed over a defined period. Each intern is registered on the internship portal with a unique registration number, is assigned a supervisor, follows a day-wise plan and maintains an attendance log. Learning is organised into three phases: **Orientation** (Days 1-2), **Learning and Practice** (Days 3-22, ten sub-topics of two days each: one concept day and one hands-on day) and **Project and Review** (Days 23-28), followed by a concluding review.

5. Role of the Supervisor

The internship supervisor assigned by the agency guided the student through the programme, explained concepts, assigned practice tasks, reviewed the daily log and gave feedback. The supervisor also verified attendance and reviewed the student's work at the end of the programme.

PLAN AND EXECUTION

1. Objectives

The internship was planned around the following objectives, each linked to a part of the programme:

1. Understand Agri Entrepreneurship - meaning, importance, types of agri ventures and the startup ecosystem (Week 1).
2. Learn business idea generation - identifying problems and generating and screening agri business ideas (Week 1).
3. Learn market opportunity study and business plan preparation - demand, competition, target market, and the sections of a business plan (Week 2).
4. Understand government schemes, funding and subsidies for agri - major subsidy and credit schemes, eligibility and funding sources (Weeks 2-3).
5. Learn cost and profit estimation and value addition and processing - costs, revenue, margin, break-even, processing options and by-products (Week 3).
6. Learn risk management and product launch planning - production, price and weather risks, and launch plan, pricing, promotion, distribution and timeline (Week 4).
7. Develop professional discipline - communication, honesty, documentation and report writing (throughout).

2. Methodology

The programme followed a blended method made up of four connected steps, repeated for each topic:

Learn. Each topic began with a concept session in which the supervisor explained the purpose of the step, its main documents and how it connects with the other steps of starting a venture. Notes were prepared in the student's own words.

Practise. The concepts were then applied in guided hands-on tasks - listing farm-to-market problems and business ideas, scoring ideas in a screening sheet, preparing a market opportunity note, drafting business plan sections, mapping schemes to a sample project, calculating costs, break-even and profit in MS Excel, planning value-added products, preparing a risk matrix and drawing up a launch timeline. Only sample or dummy data were used, so that no real farmer or business information was handled.

Document. Every day's work was recorded in the internship attendance log with a short remark, and sheets, drafts and plans were saved so that the work could be reviewed.

Review. The supervisor reviewed the work, pointed out errors and suggested improvements. Review days, a case study and a mock practical exercise helped to consolidate the learning.

3. Understanding Agri Entrepreneurship - Concepts Studied

3.1 What is agri entrepreneurship

An entrepreneur is a person who sees an opportunity, brings together land, labour, money and knowledge, takes the risk of starting a business and works to earn a profit while creating value for customers. Agri entrepreneurship applies the same idea to agriculture and the activities connected with it. Agri ventures can be grouped into several kinds. **Production ventures** grow or raise products such as vegetables, flowers, mushrooms, fruits, fish, poultry, goats, dairy, honey and vermicompost. **Processing ventures** turn raw produce into products such as flour, dal, makhana, jaggery, pickles, juice, pulp and packed snacks. **Service ventures** offer farm services, such as custom hiring of machines, drone spraying, soil testing, cold storage, transport and farm advisory. **Input ventures** supply seed, fertiliser, equipment and feed. **Marketing and technology**

ventures link farmers with buyers, provide data and apps, or sell farm produce online. Agri tourism and organic farming are further options.

Successful agri entrepreneurs usually show certain qualities: the ability to see problems as opportunities, willingness to take calculated risks, patience, hard work, learning from mistakes, good communication with farmers, customers and suppliers, honesty in dealings and the habit of keeping records. Agri entrepreneurship matters for the nation because it creates rural jobs, reduces migration, increases farm income, reduces post-harvest losses and brings new technology and better quality to food and farm products.

3.2 Agri startup ecosystem

A startup ecosystem is the network of people and institutions that help a new venture to start and grow: entrepreneurs, mentors, incubators and accelerators, universities and research institutes, banks and investors, government departments, industry associations and customers. In India, the Startup India initiative of the Government supports recognition of eligible startups through the Department for Promotion of Industry and Internal Trade (DPIIT), with benefits such as easier compliance and access to support schemes. Agricultural universities and ICAR institutes run agri-business incubators, and programmes under the Rashtriya Krishi Vikas Yojana support agri startups with mentoring and funding. The Agri-Clinics and Agri-Business Centres (ACABC) scheme, run through MANAGE with NABARD, trains agriculture graduates and diploma holders to start their own agri service ventures. Bihar has its own Start-up Policy and an Agriculture Investment Promotion Policy that support new ventures in the state.

Agri startups in India work in areas such as farm inputs and advisory, farm mechanisation and drones, post-harvest and cold chain, direct farm-to-consumer supply, agri fintech, quality testing and traceability, and processed and branded foods. Studying success stories, such as farmer groups that built their own brands or young graduates who started processing units from a small home or farm shed, shows that most ventures began small, tested the market, learned from customers and grew step by step. It also shows that failures are common, so learning from them is part of entrepreneurship.

3.3 Business idea generation

Good business ideas usually start from a problem or an unmet need. In agriculture, such problems appear everywhere along the chain: farmers who sell at low prices in the glut season, produce that spoils for lack of storage, buyers who cannot find clean and graded produce, women's groups that have skills but no market, or waste such as husk, straw and peel that has no use. Ways to find ideas are observing farms and markets, talking to farmers, traders and consumers, studying imports and prices, reading about successful ventures, using local resources and skills, and brainstorming in a group. Tools such as the problem tree, SWOT analysis (strengths, weaknesses, opportunities and threats) and mind maps help to organise thinking.

Many ideas must then be screened. A simple screening sheet scores each idea on criteria such as demand, capital needed, availability of raw material, skills and technology, profit potential, risk, legal and licence needs and fit with the entrepreneur's interest. The ideas with the highest scores are studied in more detail. Ideas that suit Bihar's conditions include makhana processing and packing, mushroom cultivation, vermicompost, millet and flour products, litchi and mango pulp or squash, jaggery, honey, fish and dairy units, goat farming, nursery and floriculture, cold storage and custom hiring of farm machines.

3.4 Market opportunity study

A market opportunity study checks whether enough customers will buy the product at a price that gives profit. It looks at the size of the demand (how many people may buy, how much, how often), the target market (who the first customers will be and where they are), the competition (who sells similar products, at what price, quality and channel), and the gap that the new venture can fill. Information is collected through primary research, such as visits to markets, conversations and short surveys with possible customers, and secondary research, such as government statistics, price data from official portals, reports and websites.

The findings are summarised in a competitor comparison, a SWOT analysis and a statement of the unique selling proposition: why a customer will choose this product, for example better quality, cleaner packing, a local brand, lower price, home delivery or new flavours. The study ends with a feasibility check from four sides: market feasibility (is there demand), technical feasibility (can it be produced with available skills, technology and raw material), financial feasibility (will it earn enough profit) and legal feasibility (are the licences and permissions obtainable). If the answers are weak, the idea is changed or dropped before money is spent.

3.5 Business plan preparation

A business plan is a written document that explains what the business will do and how it will succeed. It is used to guide the entrepreneur and to convince banks, investors and scheme authorities. For loans from banks and NABARD-supported schemes it is usually prepared in the form of a Detailed Project Report (DPR). A typical plan has the following sections: the executive summary; the business idea and objectives; the promoters and the team; the product or service; the market analysis; the marketing plan (product, price, place and promotion); the operations plan, which covers location, land and building, machinery, raw material, manpower and the process flow; the organisation and legal form; the financial plan, which covers project cost, means of finance, expected sales, costs and profit, break-even and repayment capacity; the risk analysis; the implementation timeline; and annexures such as quotations and licences.

The legal form of the venture should be chosen with care. A proprietorship is simple and cheap to start; a partnership or Limited Liability Partnership suits two or more persons; a private limited company allows outside investment; and a group of farmers can form a Farmer Producer Company or cooperative. Most small ventures register under the Udyam portal as micro, small or medium enterprises, which helps in accessing credit and schemes.

3.6 Government schemes for agri

Central and state governments offer many schemes for farmers and agri entrepreneurs, and the choice depends on the activity, the entrepreneur's category and the location. A few widely known ones are listed here for awareness and must always be checked on the official website for the current rules. **PM-KISAN** gives income support to eligible farmer families. The **Kisan Credit Card** gives short-term credit for farming needs, with interest benefit for timely repayment under the interest subvention scheme. **Pradhan Mantri Fasal Bima Yojana** provides crop insurance at a low premium. The **Agriculture Infrastructure Fund** offers loans with interest support and credit guarantee for post-harvest and community farming projects such as warehouses, cold chains, sorting, grading and primary processing. The **PM Formalisation of Micro Food Processing Enterprises (PMFME)** scheme provides credit-linked subsidy and support to micro food processing units. The **Pradhan Mantri Kisan Sampada Yojana** supports food processing and cold chain infrastructure. The **National Horticulture Mission** and the Mission for Integrated Development of Horticulture support fruit, vegetable, flower and mushroom activities, while schemes for livestock, dairy, fisheries and beekeeping support those sectors. For credit, **MUDRA** loans and **Stand-Up India** help small and new entrepreneurs, including women and members of SC and ST communities, and the **ACABC** scheme supports agri graduates.

At the state level, Bihar's agriculture department runs subsidy schemes on seeds, machines, horticulture, protected cultivation and processing, often through an online direct benefit transfer (DBT) portal, and the state has policies for agriculture investment and startups. Each scheme has eligibility conditions, a list of documents, a process of application, sanction and verification, and, in many cases, subsidy that is paid only after the project is completed. A good entrepreneur prepares a scheme map for the project: the scheme name, what it gives, who is eligible, the documents needed, the authority to approach and the expected timeline.

3.7 Cost and profit estimation

Cost and profit estimation turns the business idea into numbers. Costs are divided into capital costs (one-time, such as land, building, machinery and registrations) and operating costs (regular, such as raw material, labour, power, packing, transport, rent and interest). Operating costs are also classified as fixed costs, which do not

change with the quantity produced in the short run (such as rent, salary of a supervisor, loan interest and depreciation), and variable costs, which change with quantity (such as raw material, packing and fuel). The business also needs working capital, which is the money required to run the business until sales are realised, covering raw material stock, wages and credit given to customers.

Revenue is the quantity sold multiplied by the selling price. Profit is revenue minus total costs. Several simple measures help to judge a project. The **break-even point** is the quantity at which revenue equals total cost, and is found by dividing fixed costs by the contribution per unit (selling price minus variable cost per unit). The **margin of safety** is the share of expected sales above the break-even level. **Return on investment** is annual net profit divided by the investment, multiplied by 100. The **payback period** is the investment divided by the yearly cash profit. The **benefit-cost ratio** divides total returns by total costs, and a ratio above one shows that the project earns more than it costs. The calculations should use realistic, slightly cautious assumptions, and a sensitivity check shows what happens if prices fall or costs rise.

3.8 Value addition and processing

Value addition means increasing the worth of a farm product through cleaning, grading, processing, packing or branding. **Primary processing** includes cleaning, drying, sorting and grading. **Secondary processing** changes the form of the product, for example paddy to rice, wheat to flour, pulses to dal, milk to paneer and ghee, fruit to pulp, squash or jam, and makhana seeds to popped makhana. **Tertiary processing** makes ready-to-eat or ready-to-cook products, such as flavoured makhana snacks or packed spice mixes. By-products, such as husk, bran, whey, shells and peel, can be used for animal feed, compost, fuel or other products so that very little is wasted.

The benefits of value addition are a higher price for the same raw material, longer shelf life, a market throughout the year instead of only the harvest season, more jobs, especially for women, and a chance to build a brand. Requirements include a suitable location with water and power, machines of the right capacity, hygienic handling under good manufacturing practices, FSSAI registration or licence for food products, GST and Udyam registration where applicable, tested shelf life, proper packaging and labelling, and a market plan before production starts. Because quality failures can destroy a young brand, small units should start with a few products, a small batch and strict hygiene.

3.9 Funding and subsidies

An agri venture is financed from a mix of sources. The entrepreneur's own money (the promoter's contribution or margin money) is the first source, and lenders normally expect a share of the project cost, often ten to twenty-five per cent or more, to come from the promoter. Bank term loans finance the capital cost, and cash credit or working-capital loans finance running expenses. Banks and NABARD, SIDBI and cooperative banks offer special lines for agriculture, MSMEs and food processing. MUDRA and Stand-Up India loans help small and new entrepreneurs. Credit guarantee schemes, such as CGTMSE, allow collateral-free loans to eligible micro and small enterprises. Other sources are self-help group and bank linkage under the livelihoods mission, grants for selected agri startups from government programmes, angel investors and venture capital for scalable startups, and crowdfunding.

Most subsidies in agri and food processing are credit-linked and back-ended, which means that the subsidy is given after the bank loan is sanctioned and the project is completed and verified. The usual process is: prepare the DPR; apply online or at the bank or the concerned department; submission of KYC, project report, quotations, land or rent documents, licences and bank statements; appraisal and sanction; implementation; inspection; and release of the subsidy to the loan account. Entrepreneurs must beware of agents who promise subsidy in exchange for a fee: applications on genuine schemes are made through official portals, banks or government offices, and no one can guarantee sanction.

3.10 Risk management in agriculture

Agri ventures face several kinds of risk. **Production risk** comes from weather (drought, flood, hail, heat), pests and diseases and poor-quality inputs. **Price and market risk** comes from sudden falls in prices or loss of a

buyer. **Financial risk** arises from high debt, delayed payments and lack of working capital. **Institutional and policy risk** includes changes in export or stock rules, subsidies or taxes. **Technology and operational risk** includes machine breakdown, power failure and wrong handling, and **human risk** includes shortage of workers or poor management. Livestock and perishable ventures also face disease and spoilage risk.

Risk cannot be removed, but it can be reduced and shared. Common measures are crop and livestock insurance (such as PMFBY for crops), growing more than one crop or running more than one activity, choosing varieties and practices suited to local weather, following agro-meteorological advisories and weather forecasts, storing produce and using warehouse receipt finance, forward selling or contracts with buyers, building a customer base in more than one market, keeping an emergency fund, regular maintenance of machinery, good record keeping and keeping debts at a level that can be repaid. A risk matrix lists each risk with its likelihood, its impact and the action planned, so that the most serious risks get attention first.

3.11 Product launch planning

A launch is the moment when the product is introduced to the market, and good launches are planned. Pre-launch work includes completing the product and testing it with a small group of customers, finishing licences and registrations, finalising the brand name, logo, packaging and label, fixing the price, and arranging raw material, staff and distribution. The launch plan then sets objectives (for example the number of customers and sales in the first three months), identifies target customers and channels, decides the promotion methods and budget, and fixes a timeline with a person responsible for each task.

Promotion for a new agri product often starts locally: sampling and tasting stalls, demonstrations at farmers' fairs, local retailers and sweet shops, visits to hostels, offices and institutions, local newspapers or radio, and low-cost digital methods such as WhatsApp groups, social media posts, short videos and online listings. Distribution can begin through direct sales and a few trusted retailers before expanding. A soft launch with a small batch allows the entrepreneur to collect customer feedback, correct mistakes and fix quality before a larger launch. After the launch, sales, customer comments and cost are reviewed regularly and the plan is updated.

3.12 Registrations, ethics and limitations

Depending on the activity, an agri entrepreneur may need Udyam registration, GST registration, FSSAI registration or licence for food products, trade licence or shop establishment registration, trademark protection for the brand, pollution-related permission for some processing units and specific licences for dealing in seeds, fertilisers or pesticides under the relevant laws. Packed goods must follow Legal Metrology labelling rules. Ethical business means fair prices to farmers, honest claims about quality or organic status, safe and clean products, care for the environment and respect for workers and customers. Rules, schemes, rates and subsidy amounts change often, so every figure must be checked against current official sources, and a qualified professional should be consulted before taking a loan. An intern works only with sample data and does not handle real business or personal information.

4. Week-wise Plan and Execution

Week	Days	Activities
Week 1	Days 1-6	Orientation and foundations: company induction, introduction to agri entrepreneurship, the agri startup ecosystem, and business idea generation.
Week 2	Days 7-12	Study and planning: market opportunity study, business plan preparation and government schemes for agri, each with a concept session and a hands-on task.
Week 3	Days 13-18	Numbers and value: cost and profit estimation, value addition and processing, and funding and subsidies.
Week 4	Days 19-24	Risk and launch: risk management in agri, product launch planning, a case study exercise and a mock practical exercise.

Week	Days	Activities
Week 5	Days 25-28	Project closure: supervisor review and feedback, internship report drafting, presentation preparation and final review.

5. Week-wise Narrative

Week 1: The first week was devoted to orientation and foundations. After company induction, the student was introduced to agri entrepreneurship and studied agri startups, incubators, support organisations and success stories. The week ended with a study of business idea generation, in which problems in the farm-to-market chain were identified and several agri business ideas were generated and screened.

Week 2: In the second week the study moved to market opportunity study - demand, competition, target market and market gaps - followed by business plan preparation, covering the sections of a plan, operations, marketing and financial plan, and government schemes for agri, covering the major subsidy and credit schemes for farmers and their eligibility.

Week 3: The third week focused on cost and profit estimation, including input costs, revenue, margin and break-even; value addition and processing, including processing options, by-products and value-added products; and funding and subsidies, including loans, grants, subsidies and other funding sources for agri ventures.

Week 4: In the fourth week the student studied risk management in agri - production, price and weather risks and ways to reduce them - and product launch planning, covering the launch plan, pricing, promotion, distribution and timeline. A case study exercise and a mock practical exercise were completed in this week.

Week 5: The last week was devoted to project closure: supervisor review and feedback, drafting of the internship report, preparation of a presentation and final review before submission.

6. Topic-wise Learning in Detail

6.1 Agri Startup Ecosystem and Business Idea Generation

Concept: Agri startups, incubators, support organisations and success stories; identifying problems and generating and screening agri business ideas. *Practice carried out:* Preparing a chart of ecosystem players with their roles; listing ten farm-to-market problems; generating business ideas and scoring them in a screening sheet.

6.2 Market Opportunity Study

Concept: Demand, competition, target market and market gaps, with primary and secondary research. *Practice carried out:* Preparing a market opportunity note for a selected idea with a competitor comparison, SWOT and a statement of the unique selling proposition.

6.3 Business Plan Preparation

Concept: Business plan sections, operations, marketing and financial plan, and the legal form of the venture. *Practice carried out:* Drafting the main sections of a sample business plan, including the operations plan and process flow chart.

6.4 Government Schemes for Agri

Concept: Major subsidy and credit schemes for farmers and their eligibility. *Practice carried out:* Preparing a scheme map for the sample project listing the scheme, benefit, eligibility, documents and authority to approach, using official scheme information.

6.5 Cost and Profit Estimation

Concept: Estimating input costs, revenue, margin and break-even. *Practice carried out:* Building a cost sheet, monthly profit statement and break-even calculation in MS Excel for the sample venture, with a simple sensitivity check.

6.6 Value Addition and Processing

Concept: Processing options, by-products and value-added products. *Practice carried out:* Comparing selling raw produce with selling processed and packed products; listing by-products and their uses; preparing a licence and quality checklist for a small food unit.

6.7 Funding and Subsidies

Concept: Loans, grants, subsidies and funding sources for agri ventures. *Practice carried out:* Preparing a means-of-finance table, a loan documents checklist and a step chart of the credit-linked subsidy process.

6.8 Risk Management in Agri and Product Launch Planning

Concept: Production, price and weather risks with ways to reduce them; launch plan, pricing, promotion, distribution and timeline. *Practice carried out:* Preparing a risk matrix with actions; drawing up an eight-week launch timeline and a low-cost promotion plan.

7. Registrations, Schemes and Good Practice - Points Studied

Several registrations and rules apply to small agri ventures. **Udyam registration** gives a business its identity as a micro, small or medium enterprise and is useful for credit and schemes. **GST registration** is needed above the prescribed turnover or for certain supplies. **FSSAI registration or licence** is compulsory for food business operators, with the type depending on size. The **Legal Metrology** rules govern net quantity and labelling of packed goods, and the **Trade Marks Act, 1999** protects brand names and logos. Dealers in seeds, fertilisers and pesticides need licences under the Seeds Act, the Fertiliser Control Order and the Insecticides Act. Farmer groups that form a producer company follow the Companies Act, 2013. For incentive and subsidy schemes, the **scheme guidelines** issued by the concerned ministry or department are the main reference.

Good practice includes keeping a separate bank account for the venture, writing down every income and expense, issuing bills, paying farmers and workers on time, repaying loans regularly, protecting product quality and safety, reducing waste and plastic, and being honest with customers. Young entrepreneurs should also learn from experienced people, join farmer groups or incubation programmes, and start small before expanding.

8. Process Flows Studied

Process mapping was used to understand how an idea moves to a running business and who is responsible at each step. The main flows studied were:

- **From idea to venture:** Problem identified > Ideas generated > Ideas screened > Market study > Business plan > Funding and registrations > Setup > Launch > Review and growth.
- **Market study:** Define customer and product > Collect primary and secondary data > Analyse demand and competition > Find the gap > Decide go or no-go.
- **Loan and subsidy:** DPR prepared > Application and documents > Bank appraisal > Sanction > Setup and purchase > Verification > Subsidy released.
- **Processing unit operation:** Raw material purchase > Cleaning and grading > Processing > Packing and labelling > Storage > Dispatch and sale.
- **Risk management:** Identify risk > Rate likelihood and impact > Plan action > Assign owner > Monitor and update.
- **Product launch:** Product testing > Licences and branding > Price and channel > Promotion > Soft launch > Feedback > Full launch and review.

9. Worked Examples with Sample (Dummy) Data

Example A: Idea screening (dummy scores)

Four ideas were scored out of 5 on five criteria: demand, low capital need (a higher score means lower capital), availability of skills, profit potential and low risk. *Oyster mushroom unit:* 4, 5, 3, 4, 3 = 19. *Makhana processing and packing unit:* 5, 3, 3, 5, 4 = 20. *Vermicompost unit:* 3, 5, 4, 3, 4 = 19. *Dairy unit with ten animals:* 4, 2, 3, 3, 2 = 14. The makhana processing and packing unit scored highest, because demand is strong, the raw material is locally available in Bihar and a packed brand earns more than selling raw seed. It was therefore chosen for the sample business plan, while the mushroom and vermicompost units were noted as possible later additions.

Example B: Project cost and means of finance (dummy figures)

For the sample makhana processing and packing unit, the project cost and the means of finance are shown below.

Item	Basis	Amount (Rs.)
Machinery (popping, roasting, grading, sealing)	Quotations	4,00,000
Shed and civil work	Estimate	1,00,000
Registrations, licences and branding	Estimate	50,000
Working capital (first 1.5 months)	Calculated	1,50,000
Total project cost		7,00,000
Promoter's contribution	20% of cost	1,40,000
Bank term loan	80% of cost	5,60,000

Example C: Monthly profit and break-even (dummy figures)

Assume that the unit buys 1,000 kg of raw makhana seed a month at Rs. 300 per kg (Rs. 3,00,000) and, with an assumed recovery of 40%, produces 400 kg of popped makhana, which it sells in branded packs at an average of Rs. 1,100 per kg. Monthly revenue = 400 x 1,100 = Rs. 4,40,000. Variable costs are raw seed Rs. 3,00,000, labour Rs. 30,000, power and fuel Rs. 12,000, packing material Rs. 24,000 and transport and marketing Rs. 14,000, a total of Rs. 3,80,000, or Rs. 950 per kg of product. Fixed costs are shed rent Rs. 8,000, supervisor Rs. 15,000, loan interest about Rs. 4,700, depreciation about Rs. 4,200 and other expenses Rs. 3,000, a total of about Rs. 35,000. Monthly net profit = 4,40,000 - 3,80,000 - 35,000 = Rs. 25,000, or Rs. 3,00,000 a year.

The contribution per kg is 1,100 - 950 = Rs. 150, so the **break-even quantity** = 35,000 / 150 = about 233 kg a month, which is about 58% of the planned production. The **margin of safety** is (400 - 233) / 400 = about 42%. The **return on investment** = 3,00,000 / 7,00,000 x 100 = about 43%. Adding back depreciation of Rs. 50,000 a year, the yearly cash profit is about Rs. 3,50,000, so the **payback period** is 7,00,000 / 3,50,000 = about 2 years. A sensitivity check showed that if the selling price fell by 5% (to Rs. 1,045 per kg), contribution would fall to Rs. 95 per kg and monthly profit would drop to only about Rs. 3,000 (400 x 95 - 35,000), and a fall of 10% (to Rs. 990 per kg) would turn the profit into a loss of about Rs. 19,000 a month. This shows how sensitive the unit is to price and recovery, and why a strong brand and good quality control matter.

Example D: Scheme map for the sample unit (dummy mapping)

The sample unit was mapped to possible support, to be verified on official portals before use. *Udyam registration* for enterprise identity. *FSSAI registration or licence* for the food business. *PMFME scheme*: credit-linked subsidy for micro food processing units, subject to eligibility and guidelines. *Agriculture Infrastructure Fund*: loans with interest support for primary processing and post-harvest projects, subject to guidelines. *MUDRA or other bank loan* for the term loan, with *CGTMSE* credit guarantee if collateral is a problem. *State agriculture department subsidy* where the state offers support for processing. *Trademark*

application for the brand. For each scheme, the sheet noted eligibility, documents, the office to approach and the likely timeline.

Example E: Value addition comparison (dummy figures)

If the entrepreneur sold the 400 kg of popped makhana in bulk to a trader at Rs. 900 per kg, revenue would be Rs. 3,60,000, below the cost of Rs. 3,80,000 plus fixed costs, so the unit would make a loss. By grading, flavouring and packing it in 250 g branded pouches that sell at an average of Rs. 1,100 per kg, the revenue rises to Rs. 4,40,000, an increase of Rs. 80,000 in revenue, against extra packing and marketing cost of about Rs. 38,000 (packing Rs. 24,000 and marketing Rs. 14,000), which leaves a net benefit of about Rs. 42,000 a month. This shows how value addition and branding, not just production, decide whether a venture earns a profit.

Example F: Risk matrix (dummy ratings)

Five risks were rated for likelihood and impact on a scale of Low, Medium and High. A fall in selling price (Medium likelihood, High impact) will be handled by selling through at least three channels, building a brand and keeping a stock of packed goods. Shortage or high price of raw seed (Medium, High) will be handled by contracts with two or three suppliers and buying in the main season. Power cuts (High, Medium) will be handled by a generator or solar backup for the sealing and roasting machines. A quality complaint (Low, High) will be handled by batch records, lab tests of shelf life and a quick replacement policy. Delay in customer payments (Medium, Medium) will be handled by advance payment for new customers and a credit limit for regular customers.

Example G: Eight-week launch timeline (dummy)

Weeks 1 and 2: register the unit, obtain FSSAI registration, order machines and finalise packaging design. Week 3: install machines, trial production and shelf-life test. Week 4: finalise the label, price list and brand story; photograph products. Week 5: soft launch with sampling to 50 households and three retailers; collect feedback forms. Week 6: improve flavour and pack size on the basis of feedback; start a WhatsApp ordering group and social media page. Week 7: tasting stall at a local fair and visits to hostels and sweet shops. Week 8: review sales, cost and feedback against targets, plan the next two months and decide on larger batches.

10. Project: Agri Startup Business Plan

Scope. The internship work was organised around a project in which a business plan with cost-profit estimation, scheme mapping and launch strategy was developed for a sample agri venture, a makhana processing and packing unit, using sample data and templates.

Steps followed. (i) Studied the agri startup ecosystem and listed local problems and ideas; (ii) screened the ideas and selected one; (iii) prepared a market opportunity note with competitors, SWOT and unique selling proposition; (iv) drafted the business plan sections and process flow; (v) calculated project cost, means of finance, monthly profit, break-even and payback in MS Excel; (vi) mapped government schemes, prepared a risk matrix and a launch timeline, and reviewed the work with the supervisor.

Skills and tools. Business Plan Preparation, Market Feasibility, Cost Estimation, Government Schemes, Value Addition and MS Excel.

Outputs. Idea screening sheet, market opportunity note, business plan, Excel cost and break-even model, scheme map, risk matrix, launch timeline, and this internship report.

11. Case Study Exercise: A Mushroom Unit Without a Market Plan

A case study exercise was completed on a typical agri startup problem. The venture and figures are illustrative and not taken from any real person.

Background. A young graduate (fictitious) returned to his village and started an oyster mushroom unit in a small room, with an investment of about Rs. 2,00,000 partly from savings and partly from a loan. He attended a short training, bought spawn and straw and began production, attracted by stories of high profits.

Problem observed. The unit produced about 200 kg of mushrooms a month, but the cost of production came to about Rs. 90 per kg. There was no tie-up with buyers, so he sold the mushrooms to a local vendor at Rs. 60 per kg, because the product is perishable and could not be kept for more than a day or two. Some batches were damaged by contamination, and the loan instalments soon became a burden.

Analysis. The entrepreneur had studied the production technique but not the market or the costs. He had no business plan, did not calculate break-even, had not identified his customers before starting, had no cold storage or processing option for surplus, and had not planned for risks such as contamination and price fall. The venture was technically possible but commercially weak.

Recommendations. (1) Study the market first: identify hotels, restaurants, vegetable shops, hostels and sweet makers and agree supply before production. (2) Prepare a cost sheet and calculate break-even; if cost is Rs. 90 per kg, aim to sell at Rs. 120 or more through direct channels. (3) Add value, such as dried mushroom, mushroom pickle or powder, to use surplus and earn more. (4) Improve hygiene and batch records to reduce contamination. (5) Build a small cold storage or a tie-up with a nearby chiller. (6) Join a farmer group or FPO and seek support from a Krishi Vigyan Kendra and agri incubation programmes. (7) Restructure the loan schedule with the bank if needed.

Expected result and lesson learned. With a market plan, better price realisation and value-added products, the unit can reach break-even and then profit. The main lesson is that an agri entrepreneur must plan the market, the numbers and the risks before starting production, and not only learn the technology.

12. Mock Practical Exercise: From Idea to Launch of an Agri Venture

In the mock practical exercise the student carried a sample (dummy) agri venture from the first idea to the launch plan, using the formats and sheets practised earlier. The steps followed were:

1. **Idea generation:** listed local problems and four possible ventures and scored them in a screening sheet.
2. **Market opportunity:** prepared a short market study with demand, target customers, competitors, gap and unique selling proposition.
3. **Business plan:** drafted the main plan sections, the legal form and the process flow.
4. **Numbers:** prepared the project cost, means of finance, monthly profit statement, break-even and payback in Excel.
5. **Schemes and funding:** mapped schemes and subsidies and prepared a loan documents checklist.
6. **Value addition:** compared selling raw and processed products and listed by-products and licences.
7. **Risk management:** prepared a risk matrix with actions and insurance options.
8. **Launch:** drew an eight-week launch timeline and a low-cost promotion plan, and prepared a short presentation of the venture.

The exercise showed that every step depends on the one before it: a weak market study leads to wrong sales numbers, wrong numbers lead to a wrong loan size, and an unprepared launch can waste the whole effort.

13. Sample Checklists Prepared

Checklists were prepared as part of the hands-on tasks. They reduce errors and make routine work easier to review.

Idea Screening and Market Study Checklist

- Real problem or unmet need identified and described.
- Customers and their location, number and buying habits noted.
- At least five competitors or substitutes compared on price, quality and channel.
- Raw material, skills, technology and land available checked.
- Unique selling proposition written in one sentence.
- Market, technical, financial and legal feasibility checked.
- Decision of go or no-go recorded with reasons.

Business Plan Checklist

- Executive summary and objectives written clearly.
- Product, market and marketing plan included.
- Operations plan with location, machines, raw material and manpower.
- Legal form, registrations and licences listed.
- Project cost, means of finance and projections prepared.
- Break-even, payback and risk analysis included.
- Timeline and annexures such as quotations attached.

Loan and Subsidy Documents Checklist

- Identity and address proof (Aadhaar, PAN) of promoters.
- Business plan or DPR and quotations for machinery.
- Land ownership or rent agreement and building plan.
- Udyam, FSSAI and other registrations and licences.
- Bank statements and income proof as required.
- Passport photographs and bank account details.
- Scheme application form and declarations, submitted only through official channels.

Value Addition and Food Unit Checklist

- Product and recipe finalised and tested for taste and shelf life.
- Clean space with water, drainage and ventilation.
- Machines of suitable capacity and maintenance plan.
- FSSAI registration or licence and GST as applicable.
- Packaging and label with all required legal details.
- By-product use and waste disposal planned.
- Batch records and quality checks maintained.

Product Launch Checklist

- Product tested with a small group and feedback collected.
- Name, logo, packaging and label finalised.
- Price fixed with margin and discount rules.
- Channels and first customers identified.
- Promotion plan and budget prepared.
- Stock and raw material arranged for the first month.
- Review date and targets fixed after launch.

14. Tools and Resources

Learning materials, sample business plan and DPR formats, official scheme information from government portals, price and market data for sample products, MS Excel for cost sheets, break-even and profit calculations, MS Word and PowerPoint for the plan and presentation, Canva for brand and promotion material, assignments and mentor feedback were used during the internship.

15. Programme at a Glance

The programme was in the domain of Agri Entrepreneurship with RKNEXORA PRIVATE LIMITED as the agency. It required a minimum of 120 hours over 28 learning days, organised in three phases: Orientation (Days 1-2), Learning and Practice (Days 3-22) and Project and Review (Days 23-28). Attendance was recorded in the Internship Attendance Log, signed by the supervisor (see Attendance Sheet).

LEARNING OUTCOME

a. Knowledge Acquired

1. Meaning and types of agri entrepreneurship and the qualities of a successful agripreneur.
2. The agri startup ecosystem, including incubators, support organisations and initiatives such as Startup India and ACABC.
3. How to generate and screen business ideas and how to study market opportunity and competition.
4. The sections of a business plan or DPR and the choice of a legal form for the venture.
5. Major government schemes, subsidies and credit sources for agri ventures and the process of applying for them.
6. Cost and profit estimation, including fixed and variable costs, break-even, margin of safety, ROI and payback.
7. Value addition and processing, risk management and the planning of a product launch.

Glossary of Terms Learned

- **Agripreneur** - Entrepreneur who runs an agriculture-related business.
- **Startup India / DPIIT recognition** - Government initiative and recognition for eligible startups.
- **Incubator** - Organisation that supports new ventures with space, mentoring and networks.
- **ACABC** - Agri-Clinics and Agri-Business Centres scheme for training agri graduates as entrepreneurs.
- **SWOT** - Strengths, Weaknesses, Opportunities and Threats analysis.
- **USP** - Unique selling proposition: the reason a customer chooses your product.
- **Feasibility study** - Check of market, technical, financial and legal viability of an idea.
- **DPR** - Detailed Project Report, the full business plan used for loans and schemes.
- **Udyam registration** - Online registration of micro, small and medium enterprises.
- **Capital cost / Working capital** - One-time investment cost / money needed to run daily operations.
- **Fixed cost / Variable cost** - Cost that does not change with output / cost that changes with output.
- **Break-even point** - Level of sales at which total revenue equals total cost.
- **Margin of safety** - Share of sales above the break-even level.
- **ROI / Payback period** - Return on investment / time to recover the investment.
- **Value addition** - Increasing the worth of produce through processing, packing or branding.
- **By-product** - Useful product that remains from processing the main product.
- **Credit-linked subsidy** - Subsidy given in connection with a bank loan, usually after project completion.
- **Margin money** - Part of the project cost contributed by the promoter.
- **CGTMSE** - Credit guarantee scheme for collateral-free loans to micro and small enterprises.
- **PMFBY** - Pradhan Mantri Fasal Bima Yojana, the crop insurance scheme.

b. Skills Learned

Technical skills. Screening and scoring business ideas; conducting a simple market and competitor study; drafting business plan sections and process flows; preparing cost sheets, profit statements, break-even and payback calculations in MS Excel; mapping government schemes and funding documents; planning value addition; preparing risk matrices; and drawing up launch timelines.

Professional skills. Creative and problem-solving thinking; analytical and numerical skills; clear business communication and presentation; honesty and responsibility with money and records; planning and time management; teamwork and acceptance of feedback; and documentation and report writing.

These skills were developed through repeated practice and daily documentation. Preparing the sample business plan improved planning, working on cost sheets improved accuracy, role-play of presentations improved confidence, and writing remarks and reports improved communication.

c. Observed Attitude and Gained Values

1. Self-reliance and initiative: a graduate can create work for himself or herself and for others.
2. Calculated risk taking: courage must go together with homework, numbers and a plan.
3. Honesty and fairness: fair prices to farmers, true claims to customers and proper records.
4. Discipline and punctuality: regular reporting at fixed timings and daily attendance records.
5. Learning from failure: every mistake, as in the case study, teaches how to plan better.

d. Challenges Faced

Understanding business terms such as DPR, margin money, break-even and credit-linked subsidy was handled by using a glossary, reference material and mentor guidance.

Choosing realistic numbers for cost, price and recovery was difficult at first; this was handled by using conservative assumptions, writing every assumption beside the calculation and checking results with the supervisor.

Finding reliable scheme information was handled by using only official government portals and by noting that the rules must be verified before applying.

Choosing between several good ideas was handled by using the scoring sheet and discussing the result with the supervisor.

Maintaining consistent documentation was handled by using daily log entries and reviewing feedback to improve documentation progressively.

Managing time between practice, documentation and report writing was handled by dividing work week by week and using review days for corrections.

e. Career Pathways

The knowledge gained supports starting one's own agri venture and several careers, such as Agri Business Development Executive, Agri Project and DPR Preparation Assistant, Incubation or Programme Associate in agri startup programmes, Agri Credit Officer or Rural Banking Executive, Food Processing Unit Manager, FPO Manager, Agri Marketing and Sales Executive, and roles in district industries and agriculture offices. Opportunities exist in agri startups, FPOs, food processing companies, banks, development agencies and government programmes, and as an independent agri consultant. Related higher-study options include MBA in Agri-Business Management or Entrepreneurship, Master's programmes in Agricultural Economics or Rural Management, and training programmes offered by agricultural universities, Krishi Vigyan Kendras, MANAGE, NABARD and similar institutions.

CONCLUSION

The internship in Agri Entrepreneurship was a valuable learning experience that integrated academic knowledge with practical activity. The programme achieved its objectives through structured learning, guided practice, assignments, supervisor review and documentation.

The student gained a clear understanding of how an agri venture is conceived, planned and launched - through the startup ecosystem, idea generation, market study, business plan, government schemes, cost and profit estimation, value addition, funding and subsidies, risk management and launch planning - and acquired practical familiarity with screening sheets, cost models, scheme maps, risk matrices and launch timelines. The experience has strengthened the student's employability and provides a foundation for starting a venture, for further study and for work in agri-business and rural development.

Reflection

Looking back, the most useful lesson of the internship was that entrepreneurship is not only about having an idea but about testing it with the market and with numbers. The break-even exercise showed that a small change in price can change profit into loss, and the case study showed that a good technique without a market plan can fail. Moving from concept to practice to documentation made abstract ideas concrete, and supervisor feedback showed where understanding was weak. The habit of recording each day's work also made it easier to see progress over the weeks.

Objectives and Achievement

The objective of understanding the agri startup ecosystem and idea generation was achieved through concept sessions, an ecosystem chart and an idea screening sheet. The objective of learning market study and business planning was achieved by preparing a market opportunity note and a sample business plan. The objective of understanding schemes and funding was achieved through a scheme map, a means-of-finance table and a loan documents checklist. The objective of learning cost estimation and value addition was achieved by building an Excel model with break-even and payback and comparing raw and processed sale. The objective of learning risk management and launch planning was achieved through a risk matrix and an eight-week launch timeline. The objective of developing professional discipline was achieved through daily attendance, supervisor review and report writing.

Future Scope

The knowledge gained can support starting a small agri venture and further study of agri-business and entrepreneurship, and careers in agri startups, FPOs, food processing, banks and development agencies. With growing demand for processed and branded farm products, digital markets, government support for agri infrastructure and startups, and a young population in Bihar looking for opportunities close to home, trained agripreneurs are increasingly needed.

Suggestions for Improvement of the Programme

1. Include visits to a processing unit, an incubation centre and a Krishi Vigyan Kendra, and talks by successful agripreneurs, with appropriate permissions.
2. Continue regular mentor feedback and progress reviews.
3. Provide more project-based activities such as preparing a complete DPR for a local venture.
4. Encourage students to maintain detailed daily documentation.
