Signature of Student **Seal & Signature of IPO**

ACKNOWLEDGEMENT

I express my sincere gratitude to RK NEXORA, RKNEXORA PRIVATE LIMITED, _____ (College Name), my faculty mentors and the internship supervisor, _____, for their guidance and support. The structured activities, learning resources and regular feedback helped me complete this internship in Educational Technology (EdTech) successfully.

I am thankful to the Head of the Department and the college mentor for their encouragement and for guiding me in preparing this report. I am also grateful to the management of RKNEXORA PRIVATE LIMITED for providing a professional learning environment and the opportunity to learn and apply my knowledge in a practical setting. The concept sessions, hands-on tasks with demo tools and sample course material, and the supervisor's patient and detailed feedback helped me understand how digital learning is planned and delivered behind the scenes.

Finally, I thank my family and peers for their constant encouragement throughout the programme.

PREFACE

Internships are an important part of the undergraduate programme, as they allow students to see how classroom learning is applied in real organisations. The Four-Year Undergraduate Programme (FYUGP), introduced in line with the National Education Policy 2020, gives special importance to experiential learning, skill development and employability. This report has been prepared as part of the internship requirement of Magadh University and the Higher Education guidelines applicable in Bihar.

The report describes the internship undertaken in Educational Technology (EdTech) at RKNEXORA PRIVATE LIMITED, the plan followed, the work carried out, and the learning gained. Technology has changed the way people teach and learn. Live classes through video conferencing, recorded lectures, mobile learning apps, online quizzes, digital libraries and learning management systems are now part of everyday education in schools, colleges, training institutes and companies. Behind every good online course are people who know how to design learning, create content, use tools, assess learners and study data. This internship offered a first-hand introduction to that work.

The report has been arranged in the order suggested by the University, beginning with the cover page and acknowledgement and ending with the conclusion and attendance sheet. It is hoped that the report gives a clear and honest account of the internship experience. All examples in it use dummy data and fictitious names; no real learner information was handled.

EXECUTIVE SUMMARY

This report documents the internship completed in Educational Technology (EdTech) at RKNEXORA PRIVATE LIMITED (RK NEXORA - 'Campus to Career'). The programme required a minimum of 120 hours, completed over about four to five weeks (28 working days) with daily sessions of four to five hours, and was supported by an attendance log, supervisor guidance and review.

Background. Educational technology is the use of digital tools, platforms and methods to support teaching, learning and training. It includes learning management systems (LMS), online class tools, e-content, video lectures, online assessments, game elements, engagement tools and learning analytics. Good EdTech is not simply putting a class on a screen: it begins with clear learning outcomes, chooses tools that fit the learners, creates content that is easy to follow, checks learning regularly and uses data to improve. India's National Education Policy 2020 encourages the thoughtful use of technology at all levels of education, and national platforms such as DIKSHA, SWAYAM and NPTEL show how digital learning can reach many learners. For a student from any discipline, the internship shows how teaching, design, technology and data come together.

Objectives. The internship aimed to (i) build a structured understanding of the EdTech landscape, (ii) learn to set up and use a learning management system and online class tools, (iii) learn to create e-content and video lectures, (iv) learn to design assessments, gamification and student engagement activities, (v) learn how learning analytics and course design guide improvement, and (vi) develop communication, documentation and professional discipline.

Work carried out. The student first studied the EdTech landscape and learning management systems, then worked through online class tools, e-content creation, assessment tools, gamification in learning, student engagement methods, video lecture production, learning analytics and course design. Each topic had a concept session followed by a hands-on task using free or demo versions of tools and dummy learner data. The later part of the programme was devoted to a case study, a mock practical exercise, supervisor review and preparation of this report.

Project. The work was tied together in a project titled *Digital Learning Content & LMS Project*, in which e-learning content and assessments were created using online learning tools and an LMS.

Method. A blended method was followed - learn, practise, document and review - supported by a daily attendance log with day-wise remarks and regular feedback from the supervisor.

Learning gained. The student gained a clear understanding of how digital learning is planned and delivered, practical familiarity with LMS course set-up, live-class tools, slide and quiz creation, simple video editing and Canva design, awareness of accessibility, copyright and learner data privacy, and improved communication, creativity and professional discipline.

Key observations. Technology supports learning best when it follows a clear learning outcome; short, well-structured content keeps learners engaged; and regular assessment and data help teachers see who needs support.

Conclusion. The internship met its objectives and contributed to the student's academic understanding, employability and confidence. The report follows the University's suggestive format: cover page, acknowledgement, certificate, contents, preface, executive summary, about the agency, plan and execution, learning outcome, conclusion and attendance sheet.

ABOUT THE AGENCY

RK NEXORA, a unit of RKNEXORA PRIVATE LIMITED, provides structured internship and skill-development programmes under the theme 'Campus to Career'. The organization focuses on academic-industry alignment, practical exposure, assessment, documentation and employability-oriented learning.

Particulars	Details
Name of Agency	RKNEXORA PRIVATE LIMITED
Programme / Unit	RK NEXORA - Campus to Career
Registered Office	C/O Mukesh Kumar, Khiri, PS Atri, Jethiyan, Atri, Gaya - 805236, Bihar, India
CIN	U85499BR2026PTC086757
Email	rknexorapvtltd@gmail.com
Website	www.rknexora.org
Internship Topic	Educational Technology (EdTech)

1. Vision

To support students in developing practical, professional and industry-relevant capabilities.

2. Mission

To deliver structured learning experiences that connect academic knowledge with workplace expectations.

3. Activities of the Agency

1. Structured internship programmes aligned with university and higher-education requirements.
2. Skill-development learning modules, practical activities and assignments.
3. Attendance tracking, supervision, assessment and documentation.
4. Employability-oriented guidance connecting campus learning to career readiness.

4. Programme Structure

The internship programme is organised around a fixed number of learning hours, completed over a defined period. Each intern is registered on the internship portal with a unique registration number, is assigned a supervisor, follows a day-wise plan and maintains an attendance log. Learning is organised into three phases: **Orientation** (Days 1-2), **Learning and Practice** (Days 3-22, ten sub-topics of two days each: one concept day and one hands-on day) and **Project and Review** (Days 23-28), followed by a concluding review.

5. Role of the Supervisor

The internship supervisor assigned by the agency guided the student through the programme, explained concepts, assigned practice tasks, reviewed the daily log and gave feedback. The supervisor also verified attendance and reviewed the student's work at the end of the programme.

PLAN AND EXECUTION

1. Objectives

The internship was planned around the following objectives, each linked to a part of the programme:

1. Understand Educational Technology - meaning, types of EdTech, platforms and current trends (Week 1).
2. Learn learning management systems - features, course set-up, enrolment and learner tracking (Week 1).
3. Learn online class tools, e-content creation and assessment tools - live classes, slides, notes, quizzes, tests and rubrics (Week 2).
4. Learn gamification, student engagement methods and video lecture production - game elements, polls, discussions, scripting, recording and editing (Week 3).
5. Learn learning analytics and course design - learner data, progress reports, outcomes, modules and assessment plans (Week 4).
6. Develop professional discipline - communication, creativity, ethical use of content and data, documentation and report writing (throughout).

2. Methodology

The programme followed a blended method made up of four connected steps, repeated for each topic:

Learn. Each topic began with a concept session in which the supervisor explained the purpose of the tool or method, its main features and how it connects with other parts of digital learning. Notes were prepared in the student's own words.

Practise. The concepts were then applied in guided hands-on tasks - exploring a demo LMS and setting up a sample course, running a mock live class, designing slides and notes in Canva and MS PowerPoint, building quizzes and rubrics, adding game elements to a sample course, recording and editing a short video and reading a sample analytics report. Only free or demo versions of tools and dummy learner data were used, so that no real learner information was handled.

Document. Every day's work was recorded in the internship attendance log with a short remark, and drafts, screenshots and files were saved so that the work could be reviewed.

Review. The supervisor reviewed the work, pointed out errors and suggested improvements. Review days, a case study and a mock practical exercise helped to consolidate the learning.

3. Understanding Educational Technology - Concepts Studied

3.1 What is educational technology

Educational technology, or EdTech, is the study and practice of using technology to improve teaching and learning. It covers the hardware used (computers, tablets, smartphones, projectors, smart boards), the software and platforms used (learning management systems, video conferencing tools, authoring tools, quiz tools), the content created (slides, videos, simulations, e-books, quizzes) and the methods followed (blended learning, flipped classrooms, self-paced courses, live online classes). The central idea is that technology is a means and learning is the goal: a tool is chosen only because it helps a particular group of learners reach a particular learning outcome.

Learning online can be synchronous, when teacher and learners meet at the same time through a live class, or asynchronous, when learners study recorded lessons and complete activities at their own time. Many programmes combine both, and blended learning also combines online work with classroom teaching. In a flipped classroom, learners study new material at home through videos or notes and use class time for discussion and problem solving.

3.2 The EdTech landscape

The EdTech world has several types of products. Learning management systems organise courses and learners. Live-class and collaboration tools connect teachers and learners. Content and authoring tools help create slides, videos and interactive material. Assessment tools run quizzes and tests. Learning apps and platforms provide ready-made lessons and practice. Open educational resources and digital libraries offer free material. Newer trends include mobile-first and microlearning (short lessons of a few minutes), adaptive learning that changes the lesson according to the learner's performance, artificial intelligence for tutoring, feedback and content support, virtual and augmented reality, and learning analytics.

In India, government platforms have an important role. DIKSHA is a national platform for school education with QR-coded textbooks and digital lessons. SWAYAM offers free online courses from school level to postgraduate level and is linked to credit transfer under UGC rules, SWAYAM Prabha broadcasts educational video content through dedicated channels, NPTEL offers courses developed by the IITs and IISc, and e-PG Pathshala and the National Digital Library of India provide higher-education content. PM eVidya brings these efforts together. The National Education Policy 2020 supports the integration of technology in teaching, learning, assessment and administration, while also asking for attention to equity and access. Many commercial EdTech companies also serve test preparation, school learning and skill training.

A major challenge is the digital divide. Learners in villages and small towns may have limited internet speed, shared smartphones or low digital skills, so good EdTech design uses low-bandwidth content, downloadable material, mobile-friendly layouts, local-language support and offline options. Accessibility is equally important: videos need captions, images need text descriptions, and colours and fonts should be easy to read, so that learners with different needs can take part.

3.3 Learning management systems (LMS)

A learning management system is software that hosts courses, enrols learners, delivers content, collects assignments, runs quizzes, records marks and tracks progress. Well-known examples are Moodle (open source), Google Classroom, Canvas and Blackboard, and many organisations use cloud-based or custom LMS platforms. The main parts of an LMS are the user roles (administrator, teacher or instructor, learner), course pages organised into sections or modules, resources (files, links, videos), activities (assignments, forums, quizzes), gradebook, announcements and messaging, and reports.

Setting up a course in an LMS follows a clear order. First the course is created with a title, short description and outcomes. Then it is divided into modules, and resources and activities are added in a logical sequence. Next, learners are enrolled, either by the teacher, by a self-enrolment key or from a list. Completion rules, deadlines and grading are set, and the course is tested from a learner's point of view before it is opened. During the course, the teacher reads reports on logins, time spent, completed activities and scores, and sends reminders to those who are falling behind. Many LMS tools follow standards such as SCORM or xAPI so that content made in one tool can run on another.

3.4 Online class tools

Live online classes use video conferencing platforms such as Google Meet, Zoom and Microsoft Teams, together with tools such as digital whiteboards, screen sharing, chat, polls, breakout rooms and recording. A good online class has a clear structure: a short welcome and recap, a small number of key points, a learner activity every ten to fifteen minutes, time for questions and a brief summary with homework or next steps. The teacher shares the link and rules before the class, tests audio, video and screen share in advance, keeps slides simple and uses the chat and polls to hear from every learner.

Class management matters as much as technology. Teachers set ground rules for muting, camera use and respectful chat, take attendance, record the session for those who miss it and keep a backup plan, such as a phone hotspot or a pre-recorded video, in case the internet fails. Platform security settings such as waiting rooms, meeting passcodes and controlled screen sharing protect learners from unwanted visitors.

3.5 E-content creation

E-content is any learning material delivered in digital form: slides, notes, worksheets, infographics, quizzes, videos, audio, e-books and interactive lessons. Good e-content starts with the learning outcome and the learner's level, breaks the topic into small chunks, uses simple language, and combines text, images and examples so that the learner is not overloaded. Design principles that were followed include one main idea per slide, a limited number of fonts and colours, large readable text, relevant images instead of decoration, consistent layout and enough white space. Tools used for creation include MS PowerPoint, MS Word, Canva for posters, infographics and presentations, Google Forms for quizzes and, in more advanced work, interactive content tools such as H5P.

E-content must respect copyright. Under the Copyright Act, 1957, creative work belongs to its creator and cannot be copied freely. Safe practice is to create original content, use material with a Creative Commons licence or other open licence and give credit, and cite sources. Content should also be checked for factual accuracy, inclusive language and accessibility, with alternative text for images, captions for videos and good colour contrast.

3.6 Assessment tools

Assessment shows whether learners have reached the outcomes. Formative assessment happens during learning, through short quizzes, polls and activities, and gives quick feedback; summative assessment happens at the end of a unit or course, through tests or projects, and gives a final judgement. Online tools such as the LMS quiz module, Google Forms, Kahoot and Quizizz can create multiple-choice, true or false, matching, short answer and assignment-type items, mark objective questions automatically, and show results at once. Rubrics are tables that list the criteria for a task (for example content, structure, language, originality) and describe levels of performance, which makes marking fair and clear to learners.

A good question tests one idea, uses clear language, avoids tricks, gives plausible wrong options and matches the learning outcome. After a test, item analysis shows which questions were too easy or too hard: the difficulty index is the share of learners who answered correctly, and questions that every learner or no learner answers correctly may need review. Fair online assessment also needs thought about academic integrity (varied question banks, time limits, open-book designs) and about learners with weak connectivity, who may need extra time or alternative arrangements.

3.7 Gamification in learning

Gamification means adding game elements to a learning activity to increase motivation and participation. Common elements are points, badges, levels, progress bars, challenges, quests, streaks and leaderboards. It is different from game-based learning, in which a full game is itself the learning activity. Gamification works best when it supports intrinsic motivation - the learner's wish to learn, feel capable, have some choice and belong to a group - rather than relying only on rewards. For example, a badge for completing a hard module, a progress bar that shows how far the learner has come and a team challenge can encourage steady effort.

There are cautions. Leaderboards can discourage learners who are always at the bottom, so they should be optional or team-based. Points should reward learning behaviour, such as practice and reflection, and not just speed. The rules must be simple, fair and clearly explained, and the game elements must never replace good content or feedback.

3.8 Student engagement methods

Engagement means that learners are mentally and emotionally involved in learning, not just present. Online, it is shown by participation in discussions, answers to polls, completion of activities and questions asked. Methods that raise engagement include starting with a question or short story, polls and quick quizzes, think-pair-share and breakout room discussions, discussion forums with clear prompts, small group projects, case examples, short reflection tasks and timely feedback. Tools such as Mentimeter, Padlet, Google Forms and the chat feature help collect responses from everyone, including shy learners.

Engagement also depends on relationships and clarity. Teachers who learn learners' names, reply promptly, give clear instructions and deadlines, and encourage questions create a safe space for participation. Regular, short feedback forms (such as one thing learned and one thing unclear) help the teacher adjust the next session.

3.9 Video lecture production

Video lectures allow learners to study at their own pace and to repeat difficult parts. Production follows a simple process: planning (outcome, audience and length), scripting, preparing visuals, recording, editing and publishing. Research and practice both suggest that short videos of about six to ten minutes hold attention better than long lectures. A good script has a hook that states why the topic matters, the learning objective, the content in two or three clear chunks with examples, a short summary and a closing prompt such as a quiz or activity. Talking in a natural voice, as if speaking to one learner, works better than reading a text aloud.

During recording, audio quality matters more than video quality: a quiet room and a simple microphone make a big difference. For screen recordings the screen is cleaned of notifications, and for videos with a presenter the camera is kept at eye level with light falling on the face. In editing, mistakes and long pauses are cut, titles, captions and simple on-screen text are added, and the video is exported in a size suitable for mobile viewing. Tools used for this work are free or demo screen recorders and video editors, and Canva for thumbnails and title slides. The final video is uploaded to the LMS or to a video platform with a clear title, description and, if possible, a transcript or captions.

3.10 Learning analytics

Learning analytics is the collection, measurement and analysis of data about learners and their activity in order to understand and improve learning. An LMS records data such as logins, time spent, pages viewed, assignments submitted, quiz scores and course completion. Reports turn this data into progress charts and tables. Descriptive analytics tells what happened, such as how many learners completed a module. Diagnostic analytics asks why, for example by finding the point at which many learners stopped. Predictive analytics uses patterns to identify learners at risk of dropping out, so that teachers can reach out in time.

Analytics must be used responsibly. Learner data is personal data and must be collected for a clear purpose, kept safe and shared only with authorised people; the Digital Personal Data Protection Act, 2023 sets rules for handling personal data, with special care for children's data. Data should help support learners, not label or punish them, and numbers should always be read together with the real situation of the learner.

3.11 Course design

Course design is the planned process of deciding what learners should achieve and how the course will help them get there. A widely used framework is ADDIE: Analysis (who are the learners, what do they need), Design (outcomes, structure and assessment plan), Development (creating content and activities), Implementation (running the course) and Evaluation (collecting feedback and results to improve). Learning outcomes are written with action verbs from Bloom's taxonomy, which describes levels of thinking from remembering and understanding to applying, analysing, evaluating and creating. For example, 'list the parts of an LMS' tests remembering, while 'design a four-module course outline' tests creating.

The principle of constructive alignment says that outcomes, activities and assessments must match: if the outcome is to create something, the learner must practise creating and be assessed on creating, not only on recalling facts. A good course has an introduction and orientation, modules of manageable size, a logical content flow from simple to complex, varied activities, regular formative checks, a final assessment, a clear schedule and a way to collect feedback. Before launch the course is piloted with a few learners and revised.

3.12 Measuring success in EdTech

Teams track a few simple indicators to judge whether a digital course is working. **Completion rate** is learners who finished divided by learners enrolled, multiplied by 100. **Average score** and **pass percentage** show learning results. **Engagement rate** is learners who took part in an activity divided by learners enrolled. **Drop-off point** is the module where most learners stop. **Learner satisfaction** comes from feedback ratings, and **time**

to complete shows whether the course load is realistic. These numbers do not give the whole picture, but read together with learner comments they point to what should be improved first.

3.13 Ethics and limitations

EdTech professionals work with learners, often young people, and must act responsibly. They respect copyright, give credit, protect learner data and privacy, design for accessibility, avoid misleading claims about results, and ensure that technology does not leave behind those with weak access. Tools, prices, features and regulations change quickly, so every choice must be checked against the current situation. Technology also cannot replace a caring teacher: the best programmes use tools to give teachers more time for human attention, feedback and guidance.

4. Week-wise Plan and Execution

Week	Days	Activities
Week 1	Days 1-6	Orientation and foundations: company induction, introduction to educational technology, the EdTech landscape, and learning management systems.
Week 2	Days 7-12	Teaching and content tools: online class tools, e-content creation and assessment tools, each with a concept session and a hands-on task.
Week 3	Days 13-18	Motivation and media: gamification in learning, student engagement methods, and video lecture production.
Week 4	Days 19-24	Data and design: learning analytics, course design, a case study exercise and a mock practical exercise.
Week 5	Days 25-28	Project closure: supervisor review and feedback, internship report drafting, presentation preparation and final review.

5. Week-wise Narrative

Week 1: The first week was devoted to orientation and foundations. After company induction, the student was introduced to educational technology and studied the types of EdTech, popular platforms and current trends. The week ended with a study of learning management systems, including features, course set-up, enrolment and learner tracking, supported by hands-on exploration of a demo LMS.

Week 2: In the second week the study moved to online class tools - video conferencing, whiteboards and live-class features - followed by e-content creation, in which slides, notes, quizzes and digital learning material were prepared, and assessment tools, covering online quizzes, tests, rubrics and result tracking.

Week 3: The third week focused on gamification, where points, badges, challenges and game elements were studied and added to a sample course; student engagement methods such as polls, discussions, activities and feedback; and video lecture production, covering scripting, recording, editing and publishing.

Week 4: In the fourth week the student studied learning analytics - learner data, progress reports and performance trends - and course design, covering learning outcomes, modules, content flow and assessment plan. A case study exercise and a mock practical exercise were completed in this week.

Week 5: The last week was devoted to project closure: supervisor review and feedback, drafting of the internship report, preparation of a presentation and final review before submission.

6. Topic-wise Learning in Detail

6.1 EdTech Landscape

Concept: Types of educational technology, platforms and current trends, including national platforms such as DIKSHA, SWAYAM and NPTEL. *Practice carried out:* Preparing a chart of EdTech types with example tools and a one-page note on three current trends.

6.2 Learning Management Systems

Concept: LMS features, course set-up, enrolment and learner tracking. *Practice carried out:* Exploring a demo LMS as teacher and learner; creating a sample course with sections, resources and an activity; enrolling dummy learners and viewing a progress report.

6.3 Online Class Tools

Concept: Video conferencing, whiteboards and live-class tools, and basic class management. *Practice carried out:* Conducting a short mock live class with screen share, chat, poll and recording; preparing a class-rules slide and a backup plan.

6.4 E-Content Creation

Concept: Preparing slides, notes, quizzes and digital learning material using sound design principles. *Practice carried out:* Designing a short slide deck, an infographic in Canva, a one-page notes handout and a ten-question quiz on a sample topic.

6.5 Assessment Tools

Concept: Online quizzes, tests, rubrics and result tracking, with formative and summative assessment. *Practice carried out:* Building a quiz in a form tool with automatic marking, drafting a four-level rubric and doing a simple item analysis on dummy results.

6.6 Gamification in Learning and Student Engagement Methods

Concept: Points, badges, challenges and game elements; polls, discussions, activities and feedback to keep learners active. *Practice carried out:* Designing a points-and-badges scheme for a sample course; planning a ten-minute engagement sequence with a poll, a question and a feedback form.

6.7 Video Lecture Production

Concept: Scripting, recording, editing and publishing video lessons. *Practice carried out:* Writing a script and storyboard for a six-minute lesson, recording it, editing with trimming, titles and captions, and uploading it to the sample LMS course.

6.8 Learning Analytics and Course Design

Concept: Learner data, progress reports and performance trends; learning outcomes, modules, content flow and assessment plan. *Practice carried out:* Reading a dummy analytics report and listing three actions; preparing a course design document for a four-module course.

7. Important Laws, Policies and Good Practice - Points Studied

Several laws and policies affect digital learning. The **National Education Policy 2020** encourages the use of technology for teaching, learning, assessment and planning, and stresses equity and access. The **Copyright Act, 1957** protects original creative work, so content should be created originally or used with permission or an open licence, and always credited. The **Information Technology Act, 2000** deals with electronic records, digital signatures and cyber offences, and guides safe online conduct. The **Digital Personal Data Protection Act, 2023** requires organisations to collect and use personal data lawfully and for a clear purpose, to keep it safe, and to take extra care with data about children. The **UGC regulations on online and distance learning** and the **SWAYAM credit framework** set conditions under which online courses may count towards degrees.

Good practice goes beyond the law. Courses should be accessible to learners with different needs, with captions, alternative text, readable fonts and mobile-friendly design. Content should be accurate, inclusive and free from bias. Learners should be told clearly what data is collected and why. Passwords and learner records should be protected, and learners should be taught safe and respectful behaviour in online classes.

8. Process Flows Studied

Process mapping was used to understand how digital learning work moves from idea to delivery and who is responsible at each step. The main flows studied were:

- **Course creation:** Need analysis > Learning outcomes > Module plan > Content and assessments created > LMS set-up > Pilot test > Launch > Feedback and revision.
- **LMS course set-up:** Create course > Add sections > Upload resources and activities > Set completion rules and deadlines > Enrol learners > Test as learner > Open course.
- **Live class:** Plan session > Share link and rules > Test audio and screen share > Teach with activities > Record and take attendance > Share recording and follow-up.
- **Video lecture:** Outcome and audience > Script > Visuals > Recording > Editing and captions > Upload to LMS > Review learner feedback.
- **Assessment cycle:** Set outcomes > Prepare questions and rubric > Run quiz or test > Auto-mark and review > Give feedback > Analyse items > Improve questions.
- **Analytics cycle:** Collect data from LMS > Clean and summarise > Find patterns and drop-off points > Plan action > Support learners > Check results again.

9. Worked Examples with Sample (Dummy) Data

Example A: Writing learning outcomes with Bloom's verbs

For a sample course on *Digital Skills for Beginners*, vague aims such as 'understand the internet' were rewritten as measurable outcomes: (1) *Define* the terms browser, URL and search engine (remembering); (2) *Explain* how email works (understanding); (3) *Use* a search engine with keywords to find reliable information (applying); (4) *Compare* two websites for reliability (analysing); (5) *Evaluate* a message to decide if it could be a fraud (evaluating); and (6) *Create* a short presentation on safe internet use (creating). Each outcome has a matching activity and assessment.

Example B: Sample course outline for an LMS

A four-module outline was prepared for the sample course, with content, activity and assessment for each module, as shown below.

Module	Topic	Content and activity	Assessment
1	Getting started online	Welcome video, devices and browsers, forum for introductions	5-question quiz
2	Searching and email	Slides, screen-recorded demo, practice task on search keywords	Practical task with rubric
3	Staying safe online	Infographic, case examples of fraud, group discussion	10-question quiz
4	Final project	Create a safe-internet presentation	Presentation marked with rubric

Example C: Quiz item analysis

In a dummy test taken by 20 learners, Question 3 was answered correctly by 15 learners. Difficulty index = 15 / 20 = 0.75, which means the question was fairly easy. Question 7 was answered correctly by only 4 learners, giving a difficulty index of 0.20. The supervisor suggested checking Question 7 for confusing wording or a wrong key before using it again, and re-teaching the topic if the wording was clear.

Example D: Completion rate and drop-off

A free sample course was opened to 120 dummy learners. By the end, 84 had completed all modules. Completion rate = 84 / 120 x 100 = 70%. The report showed that 22 learners stopped after Module 2, the longest and most text-heavy module. The recommended action was to split Module 2 into two shorter parts, add a short video and place a small quiz in the middle.

Example E: A simple points and badges scheme

For the sample course, learners earn 10 points for watching a video to the end, 20 points for completing a quiz with at least 60%, 30 points for posting a helpful reply in the forum and 50 points for submitting the final project. Badges are awarded for 'Quick Starter' (finish Module 1 in the first week), 'Safe Surfer' (score 80% or more in the safety quiz) and 'Course Champion' (complete all modules). The scheme rewards learning actions, not speed alone, and there is no public ranking, only a personal progress bar.

Example F: Script outline for a six-minute video

A sample video on 'How to spot a fake message' was planned as follows: a 30-second hook (a real-looking fake message and the question 'Would you click?'); 30 seconds for objectives; three teaching chunks of about 90 seconds each (warning signs, safe checks and what to do); a 60-second summary; and a 30-second closing prompt pointing to the quiz. The script was written in short spoken sentences, with a text title on each chunk and captions added after editing.

Example G: Engagement snapshot

In a mock live class of 20 dummy learners, 18 joined the poll (90%), 12 used the chat to answer (60%) and 8 spoke in the breakout discussion (40%). The teacher noted that speaking participation was low, so in the next session the discussion groups were reduced to three learners each, and a sentence starter was shown on the screen. In a later mock class, speaking participation rose to 65%.

10. Project: Digital Learning Content & LMS Project

Scope. The internship work was organised around a project in which e-learning content and assessments were created using online learning tools and an LMS. A short sample course for beginners was designed, built and tested using demo tools and dummy learners.

Steps followed. (i) Studied the EdTech landscape and chose the learner group and topic; (ii) wrote learning outcomes and a four-module course design; (iii) created slides, notes and an infographic in Canva and MS PowerPoint; (iv) wrote a script, recorded and edited a short video lecture; (v) built quizzes and a rubric and added a simple points-and-badges scheme; (vi) set up the course in a demo LMS, enrolled dummy learners, read the progress report and reviewed the work with the supervisor.

Skills and tools. LMS, E-Content Creation, Online Class Tools, Assessment Tools, Video Editing and Canva.

Outputs. Course design document, slide deck and notes, infographic, short video lecture, quiz and rubric, sample LMS course, analytics summary, and this internship report.

11. Case Study Exercise: Low Completion in a Free Online Course

A case study exercise was completed on a typical EdTech problem. The organisation and figures are illustrative and not taken from any real institution.

Background. A small training institute launched a free eight-module online course on basic computer skills for young learners in nearby towns. About 500 learners enrolled in the first month, and the institute hoped that most of them would finish the course.

Problem observed. Only 90 learners (18%) completed the course. Analytics showed that most learners logged in on the first day, many stopped after the second module, and the long video lectures (about 35 minutes each) were often left unfinished. Learners who did not finish said that the videos were too long and heavy to load on mobile data, that they did not get any reminders and that there was nobody to ask questions.

Analysis. The course had been designed from the teacher's point of view, not the learner's. Long, text-heavy videos created high cognitive load and used a lot of data. There were no small quizzes or milestones, so learners had no feeling of progress. There was no reminder or support system, and no pilot test had been done with a few learners before launch.

Recommendations. (1) Break every long video into three or four short clips of six to ten minutes, with compressed versions for low bandwidth. (2) Add a short quiz and a progress bar after each module. (3) Introduce a points-and-badges scheme that rewards steady progress. (4) Send weekly reminders by message and email and open a simple help forum or a weekly doubt-clearing live session. (5) Run a pilot with a small group before every launch and collect feedback. (6) Track completion rate and drop-off by module every week.

Expected result and lesson learned. Shorter content, visible progress and human support are expected to raise completion and satisfaction. The main lesson is that a course succeeds when it is designed around the learner's time, device, data and motivation, and when data is used to improve it continuously.

12. Mock Practical Exercise: Launching a Mini Course

In the mock practical exercise the student carried a sample (dummy) mini course from planning to review, using the tools and methods practised earlier. The steps followed were:

1. **Analysis and design:** identified the learner group and topic, wrote learning outcomes and a four-module course outline with an assessment plan.
2. **Content creation:** prepared slides and notes, designed an infographic in Canva and followed accessibility basics such as readable fonts, alternative text and good contrast.
3. **Video production:** wrote a script, recorded a six-minute lesson, edited it with titles and captions and exported it in a mobile-friendly size.
4. **LMS set-up:** created the course in a demo LMS, uploaded resources, set completion rules and deadlines and enrolled dummy learners.
5. **Assessment and engagement:** built a quiz and rubric, added a simple points-and-badges scheme and planned a poll and discussion for a mock live class.
6. **Live class:** conducted a short mock live class with screen sharing, polls and chat, and recorded it.
7. **Analytics:** read the dummy progress report, calculated completion rate and listed three actions to improve the course.
8. **Review:** prepared a short reflection on what worked, what did not and what to change in the next version.

The exercise showed that every step depends on the one before it: unclear outcomes lead to weak content and weak assessments, and without data from the LMS the next version of the course cannot be improved with confidence.

13. Sample Checklists Prepared

Checklists were prepared as part of the hands-on tasks. They reduce errors and make routine work easier to review.

Course Design and LMS Set-up Checklist

- Learner group, level and device or data limits identified.
- Learning outcomes written with measurable action verbs.
- Modules planned with logical content flow and time estimates.
- Each outcome matched with an activity and an assessment.
- Course title, description, schedule and rules added in the LMS.
- Resources and activities uploaded in the right sections with clear names.
- Completion rules, deadlines and grading set and the course tested as a learner.

E-Content and Video Quality Checklist

- One main idea per slide or video chunk.
- Text is large, readable and has good colour contrast.
- Images are relevant, original or licensed, and credited.
- Alternative text added to images and captions added to videos.
- Audio is clear and the video is six to ten minutes long.
- File size is suitable for mobile data and the file opens on common devices.
- Facts, spellings and links checked before publishing.

Live Class Checklist

- Link, date and rules shared with learners in advance.
- Audio, camera, screen share and recording tested before the class.
- Waiting room or passcode set for security.
- A learner activity planned every ten to fifteen minutes.
- Polls, chat and questions used to hear from every learner.
- Attendance taken and the recording shared afterwards.
- Backup plan ready for internet or power failure.

Assessment and Analytics Checklist

- Each question matches a learning outcome and tests one idea.
- Answer key and marks checked; wrong options are plausible.
- Rubric criteria and levels are clear and shared with learners.
- Time limit and attempts set fairly, with alternatives for weak connectivity.
- Results and feedback shared quickly with learners.
- Item analysis, completion rate and drop-off points reviewed.
- Learner data stored safely and used only for learning support.

14. Tools and Resources

Learning materials, demo or free versions of an LMS (such as Moodle or Google Classroom), video conferencing tools (such as Google Meet), Canva, MS PowerPoint and MS Word for content, Google Forms and online quiz tools for assessment, free screen recording and video editing software, sample analytics reports,

national platforms such as DIKSHA, SWAYAM and NPTEL for reference, assignments and mentor feedback were used during the internship.

15. Programme at a Glance

The programme was in the domain of Educational Technology (EdTech) with RKNEXORA PRIVATE LIMITED as the agency. It required a minimum of 120 hours over 28 learning days, organised in three phases: Orientation (Days 1-2), Learning and Practice (Days 3-22) and Project and Review (Days 23-28). Attendance was recorded in the Internship Attendance Log, signed by the supervisor (see Attendance Sheet).

LEARNING OUTCOME

a. Knowledge Acquired

1. Meaning and scope of educational technology, the main types of EdTech and the national platforms such as DIKSHA, SWAYAM and NPTEL.
2. How a learning management system is organised and how a course is set up, learners enrolled and progress tracked.
3. How live online classes are planned and managed with video conferencing, whiteboards, polls and recording.
4. Principles of good e-content and video lectures, including short chunks, simple design, accessibility and copyright.
5. Assessment design with quizzes, rubrics and item analysis, and the use of gamification and engagement methods to motivate learners.
6. Basics of learning analytics, such as completion rate and drop-off points, and the responsible use of learner data.
7. Course design using the ADDIE framework, Bloom's taxonomy and constructive alignment.

Glossary of Terms Learned

- **EdTech** - Educational Technology: use of digital tools and methods for teaching and learning.
- **LMS** - Learning Management System: software that hosts courses, learners, activities and reports.
- **Synchronous / Asynchronous learning** - Learning at the same time (live) / at the learner's own time.
- **Blended learning** - A mix of online and classroom learning.
- **Flipped classroom** - Learners study content at home and use class time for activities.
- **MOOC** - Massive Open Online Course open to large numbers of learners.
- **SWAYAM / NPTEL / DIKSHA** - Indian platforms for online courses and digital school content.
- **E-content** - Learning material in digital form such as slides, notes, videos and quizzes.
- **Microlearning** - Learning in very short lessons of a few minutes.
- **Formative / Summative assessment** - Assessment during learning to give feedback / at the end to give a final result.
- **Rubric** - Table of criteria and performance levels used for marking.
- **Gamification** - Use of game elements such as points and badges in learning.
- **Engagement** - Active mental and emotional involvement of learners.
- **Learning analytics** - Analysis of learner data to understand and improve learning.
- **Completion rate** - Learners who finished divided by learners enrolled, as a percentage.
- **ADDIE** - Analysis, Design, Development, Implementation, Evaluation model of course design.
- **Bloom's taxonomy** - Levels of thinking from remembering to creating, used to write outcomes.
- **SCORM / xAPI** - Standards that let e-learning content work across different LMS platforms.
- **Accessibility** - Design that lets learners with different needs use and understand content.
- **Creative Commons** - Licences that allow reuse of content under stated conditions.

b. Skills Learned

Technical skills. LMS course set-up and learner enrolment; running live classes with online tools; designing slides, notes and infographics in PowerPoint and Canva; creating quizzes and rubrics; scripting, recording and editing simple videos; reading basic analytics reports; and writing course outlines and learning outcomes.

Professional skills. Clear communication and explanation; creativity and visual design; empathy for the learner's point of view; ethical use of content and data; time management and planning; teamwork and acceptance of feedback; and documentation, report writing and presentation.

These skills were developed through repeated practice and daily documentation. Building a sample course improved planning, creating content improved design and writing, mock classes improved confidence and communication, and writing remarks and reports improved clarity of expression.

c. Observed Attitude and Gained Values

1. Learner-centred thinking: every tool and design choice should be judged by how it helps the learner.
2. Creativity with responsibility: original ideas must go along with respect for copyright and accuracy.
3. Inclusion and fairness: content and tools must be usable by learners with limited devices, data or different abilities.
4. Discipline and punctuality: regular reporting at fixed timings and daily attendance records.
5. Integrity and privacy: learner information must be protected and used only to support learning.

d. Challenges Faced

Understanding new terms such as LMS, SCORM, rubric and item analysis was handled by using a glossary, reference material and mentor guidance.

Learning several tools in a short time was handled by practising each tool on a small task the same day and keeping short step notes for revision.

Keeping content simple was difficult at first because many ideas wanted to be included in one slide or video; this was handled by following the one-idea-per-slide rule and taking the supervisor's feedback.

Working with limited internet speed while recording and uploading videos was handled by compressing files, working in short sessions and saving drafts regularly.

Maintaining consistent documentation was handled by using daily log entries and reviewing feedback to improve documentation progressively.

Managing time between practice, documentation and report writing was handled by dividing work week by week and using review days for corrections.

e. Career Pathways

The knowledge gained supports further study and careers such as Instructional Designer, E-Learning Content Developer, LMS Administrator or Coordinator, Online Course Coordinator, Video Lecture Editor, Learning Support Executive, Learning Analytics Assistant and EdTech Operations Executive, as well as teaching and training roles that use digital tools. Opportunities exist in EdTech companies, schools and colleges, coaching and training institutes, corporate learning and development teams and government digital education programmes. Related higher-study options include B.Ed. and M.Ed. with a focus on educational technology, Master's programmes in Educational Technology, Instructional Design or Learning Sciences, and certificate courses on SWAYAM and similar platforms.

CONCLUSION

The internship in Educational Technology (EdTech) was a valuable learning experience that integrated academic knowledge with practical activity. The programme achieved its objectives through structured learning, guided practice, assignments, supervisor review and documentation.

The student gained a clear understanding of how digital learning is planned and delivered - through the EdTech landscape, learning management systems, online class tools, e-content, assessment tools, gamification, engagement methods, video lectures, learning analytics and course design - and acquired practical familiarity with LMS set-up, content design in Canva and PowerPoint, quiz and rubric creation, video editing and analytics reading. The experience has strengthened the student's employability and provides a foundation for further study and work in education, training and learning technology.

Reflection

Looking back, the most useful lesson of the internship was that technology becomes powerful in education only when it is guided by a clear learning purpose and a good understanding of the learner. A beautiful video or a smart tool does not help if the outcome is unclear, the content is too long or the learner has no support. Moving from concept to practice to documentation made abstract ideas concrete, and supervisor feedback showed where understanding was weak. The habit of recording each day's work also made it easier to see progress over the weeks.

Objectives and Achievement

The objective of understanding the EdTech landscape was achieved through concept sessions, a chart of EdTech types and a study of national platforms. The objective of learning LMS and online class tools was achieved by setting up a sample course in a demo LMS and conducting a mock live class. The objective of creating content, assessments and video was achieved through slides, an infographic, quizzes, a rubric and an edited video lecture. The objective of understanding gamification, engagement, analytics and course design was achieved through a points-and-badges scheme, an engagement plan, a dummy analytics report and a course design document. The objective of developing professional discipline was achieved through daily attendance, supervisor review and report writing.

Future Scope

The knowledge gained can support further study of educational technology and instructional design, and careers in EdTech companies, schools, colleges, training institutes and corporate learning teams. With growing smartphone use, government digital education initiatives, skill-based learning and the use of artificial intelligence in education, trained professionals who can design good digital learning are increasingly needed.

Suggestions for Improvement of the Programme

1. Include visits or talks by teachers and instructional designers who use technology, with appropriate permissions.
2. Continue regular mentor feedback and progress reviews.
3. Provide more project-based activities such as building and testing a full mini course with real volunteer learners.
4. Encourage students to maintain detailed daily documentation.
