ACKNOWLEDGEMENT

I express my sincere gratitude to RK NEXORA, RKNEXORA PRIVATE LIMITED, _____ (College Name), my faculty mentors and the internship supervisor, _____, for their guidance and support. The structured activities, learning resources and regular feedback helped me complete this internship in Enterprise Resource Planning (ERP) successfully.

I am thankful to the Head of the Department and the college mentor for their encouragement and for guiding me in preparing this report. I am also grateful to the management of RKNEXORA PRIVATE LIMITED for providing a professional learning environment and the opportunity to learn and apply my knowledge in a practical setting. The concept sessions, hands-on tasks with sample data and case studies, and the supervisor's patient and detailed feedback helped me understand how an ERP system connects the departments of a business.

Finally, I thank my family and peers for their constant encouragement throughout the programme.

PREFACE

Internships are an important part of the undergraduate programme, as they allow students to see how classroom learning is applied in real organisations. The Four-Year Undergraduate Programme (FYUGP), introduced in line with the National Education Policy 2020, gives special importance to experiential learning, skill development and employability. This report has been prepared as part of the internship requirement of Magadh University and the Higher Education guidelines applicable in Bihar.

The report describes the internship undertaken in Enterprise Resource Planning (ERP) at RKNEXORA PRIVATE LIMITED, the plan followed, the work carried out, and the learning gained. Every business, small or large, has several departments - sales, purchase, stores, accounts and human resources - and each one needs information from the others. When these departments keep separate registers or separate sheets, the same data is typed again and again, figures do not match and decisions are delayed. An Enterprise Resource Planning (ERP) system solves this by keeping the whole business on one connected software platform with one database. In India, ERP systems are used from large manufacturers to small trading firms, and the knowledge of how they work is valuable for careers in accounts, supply chain, HR, consulting and business analysis. This report describes how the main modules of an ERP system were studied and how a complete business process was followed through them using dummy data.

The report has been arranged in the order suggested by the University, beginning with the cover page and acknowledgement and ending with the conclusion and attendance sheet. It is hoped that it gives a clear and honest account of the internship experience. All examples in this report use dummy data and fictitious names; no real personal or business information has been handled.

EXECUTIVE SUMMARY

This report documents the internship completed in Enterprise Resource Planning (ERP) at RKNEXORA PRIVATE LIMITED (RK NEXORA - 'Campus to Career'). The programme required a minimum of 120 hours, completed over about four to five weeks (28 working days) with daily sessions of four to five hours, and was supported by an attendance log, supervisor guidance and review.

Background. An ERP system is an integrated software suite that manages the main processes of an organisation - finance, sales, purchase, inventory, human resources and more - on one platform with a single central database. When a sales order is entered, the stock is reduced, the invoice is raised, and the accounts are updated automatically, without anyone typing the same figures again. This gives one version of the truth, saves time, reduces errors and gives managers up-to-date reports. The main modules studied in the internship were Finance, Sales, Inventory, Procurement and HR and Payroll, together with master data and dashboards.

Objectives. The internship aimed to (i) understand ERP architecture and the idea of integrated modules, (ii) learn the Finance module - ledgers, journal entries, payables and receivables, (iii) learn the Sales module and the order-to-cash cycle, (iv) learn the Inventory module and stock control, (v) learn the Procurement process and the procure-to-pay cycle, (vi) learn HR and Payroll, (vii) understand master data, and (viii) read dashboards and reports and study how a process moves across modules.

Work carried out. Each topic had a concept session followed by a hands-on task in which sample transactions were entered or worked out on a practice ERP set-up and on spreadsheets that imitate the ERP screens, using a fictitious trading company. The student followed the same business through the order-to-cash and procure-to-pay cycles, prepared payroll for dummy employees, checked stock against reorder levels and read dashboard reports. The later part of the programme was devoted to the project, a case study exercise, a mock practical exercise, supervisor review and preparation of this report.

Project. The work was tied together in a project titled **ERP Module Implementation & Process Study**. The study followed a fictitious grocery wholesaler, Magadh Traders, through the Finance, Inventory, Procurement, Sales and HR and Payroll modules, mapping each business transaction to the ERP document it creates, the module it touches and the accounting entry it produces, and then reading the resulting reports.

Method. A blended method was followed - learn, practise, document and review - supported by a daily attendance log with day-wise remarks and regular feedback from the supervisor.

Learning gained. The student gained a clear understanding of ERP architecture and modules, practical familiarity with master data, purchase and sales documents, stock movement, journal entries, payroll calculation and dashboards, and an ability to trace one transaction through several departments.

Key observations. An ERP system is only as good as its data and its discipline: wrong master data gives wrong reports in every module; each transaction must be entered once, at the right place; and the real benefit comes when departments follow the same process rather than their own shortcuts.

Conclusion. The internship met its objectives and contributed to the student's academic understanding, employability and confidence. The report follows the University's suggestive format: cover page, acknowledgement, certificate, contents, preface, executive summary, about the agency, plan and execution, learning outcome, conclusion and attendance sheet.

ABOUT THE AGENCY

RK NEXORA, a unit of RKNEXORA PRIVATE LIMITED, provides structured internship and skill-development programmes under the theme 'Campus to Career'. The organization focuses on academic-industry alignment, practical exposure, assessment, documentation and employability-oriented learning.

Particulars	Details
Name of Agency	RKNEXORA PRIVATE LIMITED
Programme / Unit	RK NEXORA - Campus to Career
Registered Office	C/O Mukesh Kumar, Khiri, PS Atri, Jethiyan, Atri, Gaya - 805236, Bihar, India
CIN	U85499BR2026PTC086757
Email	rknexorapvtltd@gmail.com
Website	www.rknexora.org
Internship Topic	Enterprise Resource Planning (ERP)

1. Vision

To support students in developing practical, professional and industry-relevant capabilities.

2. Mission

To deliver structured learning experiences that connect academic knowledge with workplace expectations.

3. Activities of the Agency

1. Structured internship programmes aligned with university and higher-education requirements.
2. Skill-development learning modules, practical activities and assignments.
3. Attendance tracking, supervision, assessment and documentation.
4. Employability-oriented guidance connecting campus learning to career readiness.

4. Programme Structure

The internship programme is organised around a fixed number of learning hours, completed over a defined period. Each intern is registered on the internship portal with a unique registration number, is assigned a supervisor, follows a day-wise plan and maintains an attendance log. Learning is organised into three phases: **Orientation** (Days 1-2), **Learning and Practice** (Days 3-22, ten sub-topics of two days each: one concept day and one hands-on day) and **Project and Review** (Days 23-28), followed by a concluding review.

5. Role of the Supervisor

The internship supervisor assigned by the agency guided the student through the programme, explained concepts, assigned practice tasks, reviewed the daily log and gave feedback. The supervisor also verified attendance and reviewed the student's work at the end of the programme.

PLAN AND EXECUTION

1. Objectives

The internship was planned around the following objectives, each linked to a part of the programme:

1. Understand ERP architecture, modules and how data flows between departments (Week 1).
2. Understand master data - customers, vendors, items and employees - and why accuracy matters (Week 1).
3. Learn the Finance module: chart of accounts, ledgers, journal entries, payables, receivables and financial statements (Week 2).
4. Learn the Sales module and the order-to-cash cycle, and the Inventory module with stock movement and reorder levels (Weeks 2-3).
5. Learn the Procurement process and the procure-to-pay cycle (Week 3).
6. Learn HR and Payroll - employee records, attendance, salary structure, deductions and payslips (Week 4).
7. Read dashboards and reports, and study one business process end to end (Weeks 4-5).

2. Methodology

The programme followed a blended method made up of four connected steps, repeated for each topic:

Learn. Each topic began with a concept session in which the supervisor explained the idea, its main terms and how it is used in real organisations. Notes were prepared in the student's own words.

Practise. The concepts were then applied in guided hands-on tasks - creating sample customer, vendor, item and employee records, posting journal entries, preparing a quotation, sales order, delivery and invoice, raising a purchase order and recording goods receipt, calculating reorder levels, preparing a payslip, and reading the KPIs of a dashboard. Only sample data and fictitious examples were used, so that no real personal or business information was handled.

Document. Every day's work was recorded in the internship attendance log with a short remark, and sheets, files and screenshots were saved so that the work could be reviewed.

Review. The supervisor reviewed the work, pointed out errors and suggested improvements. Review days, a case study and a mock practical exercise helped to consolidate the learning.

3. Understanding Enterprise Resource Planning (ERP) - Concepts Studied

3.1 What is ERP and why do businesses use it?

Before ERP, each department of a business used its own register, sheet or small software. The sales team had its list of customers, the store had its stock register and the accounts section had its books, and they rarely agreed. ERP replaces these separate systems with modules that share one database. Examples of ERP products used in India are SAP, Oracle, Microsoft Dynamics, Tally Prime (for accounts and inventory), Zoho Books and the open-source ERPNext and Odoo. The main benefits are a single source of data, automation of routine entries, faster and more accurate reports, better control over stock and money, and the ability to grow without changing systems. The main challenges are the cost, the time needed to implement, the effort of training staff and the resistance to change.

3.2 ERP architecture and data flow

An ERP system has three broad layers: the user layer, through which people enter data and see reports on screens or the web; the application layer, where the modules and business rules (workflows) work; and the database layer, in which all the data is stored. Because the modules use the same database, a transaction made in one module appears at once in the others. For example, the goods receipt entered by the store increases the stock in Inventory, creates a liability in Finance and makes the purchase order show as received in Procurement. The figure below shows this architecture.

Figure 1: Layers of an ERP system - users, modules, business rules and database

3.3 Integration of processes: order-to-cash and procure-to-pay

The value of ERP is seen most clearly in two cycles that cut across modules. In the procure-to-pay cycle, a need for goods leads to a purchase requisition, a purchase order to a vendor, the goods receipt in the store, the vendor invoice and finally the payment. In the order-to-cash cycle, a customer enquiry leads to a quotation, a sales order, a delivery from stock, an invoice and finally the receipt of money. Each step creates a document, and each document is linked to the previous one, so that the whole history of a transaction can be traced.

Figure 2: The procure-to-pay cycle

Figure 3: The order-to-cash cycle

3.4 Master data and transaction data

ERP data is of two kinds. Master data is the relatively permanent information about the things the business deals with: customers, vendors, items, employees, accounts and warehouses. Transaction data is the record of day-to-day events: orders, invoices, receipts and payments. Master data is created once and used again and again, so an error in it - a wrong GST number, a duplicate customer or a wrong unit of measure - repeats in every transaction. For this reason, standard formats, a clear approval for new master records and regular cleaning of duplicates are essential.

3.5 The Finance module in more detail

The Finance module is the heart of an ERP system because every other module finally posts its money values here. It is built on the chart of accounts, which is the numbered list of all accounts in five groups: assets (what the business owns), liabilities (what it owes), equity (the owner's stake), income and expenses. Every transaction is recorded as a journal entry in which the total of the debits equals the total of the credits, so the books always balance. In a manual system the accountant makes these entries; in an ERP system most of them are made automatically by the other modules, and the accountant reviews and corrects them.

Account group	Examples	Normal balance	Appears in
Assets	Cash, bank, stock, accounts receivable, furniture	Debit	Balance sheet
Liabilities	Accounts payable, GST payable, loans	Credit	Balance sheet
Equity	Owner's capital, retained profit	Credit	Balance sheet
Income	Sales revenue, interest received	Credit	Profit and loss
Expenses	Purchases, salaries, rent, electricity	Debit	Profit and loss

The sub-ledgers of accounts receivable and accounts payable keep a separate account for each customer and vendor, and their totals agree with the control accounts in the general ledger. The ageing report groups the unpaid invoices by how old they are - 0 to 30 days, 31 to 60 days and so on - and is the main tool for collecting money on time. At the end of the period the trial balance is taken, and from it the income statement (profit or loss) and the balance sheet are prepared. The student practised these steps with twelve sample entries, such as a purchase on credit, a cash sale, payment of rent, receipt from a customer, payment of salary and charging of depreciation, and checked that the trial balance agreed after each batch of entries.

3.6 The Sales and Inventory modules in more detail

The Sales module manages the customer side of the business. It begins with the customer master, which holds the name, address, GST number, credit limit and payment terms. A quotation gives the price offered to the customer; when the customer agrees, it is converted into a sales order, which reserves the stock. The delivery note records the goods that leave the warehouse, and the tax invoice, which is the legal document for payment, is raised against it. The system can check at each step - whether the credit limit is exceeded, whether stock is available and whether the price is as per the price list - and can stop the process if a rule is broken.

The Inventory module keeps the record of every item in every warehouse. The item master holds the code, description, unit of measure, tax rate and costing method. Each receipt, issue and transfer is a stock movement, and the stock ledger is the running record of these movements. Stock may be valued by methods such as first in first out (FIFO) or weighted average cost, and the choice affects the cost of goods sold and the profit. The module also supports batch and expiry tracking, which is important for food, medicine and chemicals, and periodic physical counts, whose differences are posted as adjustments after approval. The key inventory measures studied were stock turnover (cost of goods sold divided by average stock), days of stock on hand and the number of items below the reorder level.

3.7 The Procurement module and vendor management

The Procurement module handles buying. A department raises a purchase requisition for what it needs, which is approved according to the amount. The purchasing staff then ask for quotations from several vendors, compare them on price, quality, delivery time and payment terms, and issue a purchase order to the chosen vendor. When the goods arrive, the store prepares a goods receipt note, and when the vendor's invoice comes, the system performs the three-way match of order, receipt and invoice. The invoice is paid on the due date according to the payment terms, and discounts for early payment can be claimed.

Criterion	Weight	Vendor A	Vendor B	Vendor C
Price	40%	8	7	9
Quality	30%	9	8	6
Delivery time	20%	7	9	8
Payment terms	10%	6	7	8
Weighted score	100%	7.9	7.7	7.7

The table shows the vendor evaluation exercise carried out with dummy scores out of 10. The weighted score of Vendor A is (8 x 0.40) + (9 x 0.30) + (7 x 0.20) + (6 x 0.10) = 3.2 + 2.7 + 1.4 + 0.6 = 7.9, and the scores of Vendor B (7.7) and Vendor C (7.7) were worked out in the same way. Vendor A was therefore selected, although its payment terms were the weakest, because price and quality carried the greatest weight. The exercise showed that a clear method makes vendor selection fair and easy to explain.

3.8 The HR and Payroll module in more detail

The HR module keeps the employee master with personal details, joining date, department, designation, bank account and statutory numbers. The attendance and leave records are the input of payroll: the number of days worked, the days of leave and any overtime decide the salary of the month. The salary structure of each employee is defined once, with earnings such as basic pay, house rent allowance and special allowance, and deductions such as the provident fund, employee state insurance, professional tax and income tax deducted at source. When payroll is run, the system calculates the gross salary, the deductions and the net salary for every employee, produces the payslips and the bank transfer file, and posts the totals to the accounts.

Statutory rules are an important part of payroll. In India, the provident fund is generally calculated on the basic pay at 12% from both the employee and the employer, the employee state insurance applies to employees below a wage limit, and professional tax is levied by the state. These rates and limits change from time to time, so the student noted that they must always be confirmed from the official notifications and updated in the system by an authorised person. Payroll data is among the most confidential data in a business and is protected by role-based access.

3.9 Implementing an ERP system

The implementation of an ERP system is a project, and its success depends more on people and process than on technology. The usual stages are: planning and selection of the product; analysis of the present processes and the requirements; configuration of the system, including the chart of accounts, tax rates and approval rules; preparation and migration of master data and opening balances; testing with real scenarios; training of users; parallel running of the old and new systems for a period; and go-live followed by support. Common causes of failure are unclear requirements, too much customisation, poor data quality, inadequate training and lack of involvement of senior management.

Option	Meaning	Advantage	Limitation
On-premise ERP	Installed on the company's own servers	Full control of data and customisation	High cost and need for IT staff

Option	Meaning	Advantage	Limitation
Cloud ERP	Used through the internet on a subscription	Low start-up cost, easy updates, access from anywhere	Dependence on internet and the provider
Open-source ERP	Source code is free to use and change	No licence fee, flexible	Needs technical skill for set-up and support

For small businesses in Bihar, cloud and open-source options are often the practical starting point because they need little capital, can be started with one or two modules and can grow with the business.

3.10 Reports, KPIs and dashboards

The final benefit of ERP is information. Because all the data is in one database, reports can be produced at any time: the stock summary, the sales by item or customer, the receivables ageing, the trial balance, the payroll summary and the profit and loss statement. A dashboard presents the key performance indicators (KPIs) on one screen with numbers and charts, such as sales this month against last month, gross margin percentage, stock below reorder level, receivables over 30 days and the number of purchase orders pending. The student learnt that a KPI must be clearly defined, measurable and reviewed regularly, and that managers should look at trends and exceptions instead of reading every number. A good dashboard leads to action, such as calling the customers with overdue payments or reordering the items that are running low.

4. Week-wise Plan and Execution

Week	Days	Activities
Week 1	Days 1-6	Orientation and foundations: company induction, introduction to ERP, ERP architecture and master data, each with a study session and a practice task.
Week 2	Days 7-12	Core modules: Finance - ledgers, journal entries, payables and receivables - and the Sales module with the order-to-cash cycle.
Week 3	Days 13-18	Operations modules: Inventory with stock movement and reorder levels, and the Procurement process.
Week 4	Days 19-24	People and analysis: HR and Payroll, dashboards and analytics, the process study project, a case study exercise and a mock practical exercise.
Week 5	Days 25-28	Project closure: supervisor review and feedback, internship report drafting, presentation preparation and final review.

5. Week-wise Narrative

Week 1: The first week was devoted to orientation and foundations. After company induction, the student studied what ERP is, why businesses use it and how its architecture is organised, and then practised creating master data for customers, vendors, items and employees in standard formats.

Week 2: In the second week the student studied the Finance module - the chart of accounts, ledgers, journal entries, accounts payable and receivable and the financial statements - followed by the Sales module and the order-to-cash cycle from quotation to invoice.

Week 3: The third week was devoted to the Inventory module, covering the item master, warehouses, stock movement and reorder levels, and to the Procurement process from requisition to goods receipt and vendor payment.

Week 4: In the fourth week the student studied HR and Payroll, prepared payslips for dummy employees, and read dashboards and reports. The process study project was completed and a case study and a mock practical exercise were carried out.

Week 5: The last week was devoted to project closure: supervisor review and feedback, drafting of the internship report, preparation of a presentation and final review before submission.

6. Topic-wise Learning in Detail

6.1 ERP Architecture

Concept: Modules, the central database, user interface layers and how data flows between departments. **Practice carried out:** Drawing the architecture of an ERP system and tracing how one sales order updates Sales, Inventory and Finance.

6.2 The Finance Module

Concept: Chart of accounts, ledgers, journal entries, accounts payable and receivable, and financial statements. **Practice carried out:** Posting twelve sample journal entries, preparing a trial balance and an ageing list of receivables, and reading a profit and loss statement.

6.3 The Sales Module

Concept: Customer records, quotations, sales orders, delivery and the order-to-cash cycle. **Practice carried out:** Preparing a quotation, converting it into a sales order and an invoice with GST, and tracking the receipt of payment.

6.4 The Inventory Module

Concept: Item master, stock levels, warehouses, stock movement and reorder levels. **Practice carried out:** Recording stock receipts and issues, preparing a stock ledger, and calculating reorder levels for five items (section 9).

6.5 The Procurement Process

Concept: Vendor selection, purchase requisitions, purchase orders and goods receipt. **Practice carried out:** Comparing three vendor quotations, raising a purchase order and matching the order, receipt and invoice (the three-way match).

6.6 HR and Payroll

Concept: Employee records, attendance, salary structure, deductions and payslip generation. **Practice carried out:** Preparing a salary structure with basic pay, allowances, PF and professional tax and generating payslips for four dummy employees.

6.7 Master Data

Concept: Customers, vendors, items and employees; standard formats and why data accuracy matters. **Practice carried out:** Cleaning a list of duplicate and wrongly formatted customer records and writing a master data checklist.

6.8 Dashboards and Analytics

Concept: Reading KPIs, charts and summary reports to understand business performance. **Practice carried out:** Reading a sales dashboard, identifying the top items and slow-moving stock, and writing a short interpretation.

7. Good Practice, Controls and Ethics - Points Studied

An ERP system holds the money, stock and people data of a business, so discipline and control are part of using it. The points studied are summarised below.

- **Enter once, at the source:** each transaction is entered by the department that knows it best, and not retyped elsewhere.
- **Segregation of duties:** the person who raises a purchase order should not approve the payment, to prevent fraud.
- **Access control:** every user gets only the access that the job needs, with a personal password.
- **Audit trail:** the system records who did what and when; entries are corrected by reversal, not by deleting.

- **Data accuracy:** master data is created in standard formats and checked before it is used.
- **Statutory compliance:** invoices follow GST rules and payroll follows the provident fund, ESI and tax rules.
- **Confidentiality:** salary, customer and vendor data are confidential, and the Digital Personal Data Protection Act, 2023 applies to personal data.

8. Process Flows Studied

8.1 Three-way match in procurement

- The purchase order states the item, quantity and agreed price.
- The goods receipt records what the store actually received.
- The vendor invoice states what the vendor is asking to be paid.
- The system compares all three; if they agree, the invoice is approved for payment, and if not, the difference is investigated first.

8.2 Month-end closing steps

- Check that all sales, purchase and stock transactions of the month are entered.
- Reconcile bank and cash balances with the books.
- Post adjusting entries such as depreciation and accruals.
- Take the trial balance, review the reports and lock the period.

9. Worked Examples with Sample (Dummy) Data

Worked example 1 - reorder levels in the Inventory module. For a fictitious grocery wholesaler, Magadh Traders, the average daily demand, the supplier's lead time and a safety stock were used to find the reorder level: reorder level = (average daily demand x lead time) + safety stock. When the stock falls to this level, the ERP shows a reorder alert and a purchase requisition can be raised.

Item	Daily demand	Lead time (days)	Safety stock	Reorder level	Stock on hand	Action
Rice 25 kg bag	10	5	20	70	120	Stock is enough
Dal 10 kg bag	6	4	12	36	45	Stock is enough
Mustard oil 15 L	4	7	6	34	30	Reorder now
Sugar 25 kg bag	8	3	10	34	80	Stock is enough
Tea 1 kg pack	3	6	8	26	18	Reorder now

Two items, mustard oil and tea, had fallen below their reorder levels and were flagged for purchase. The stock position against the reorder level is shown in the chart below (the chart shows the stock on hand; the reorder levels are in the table).

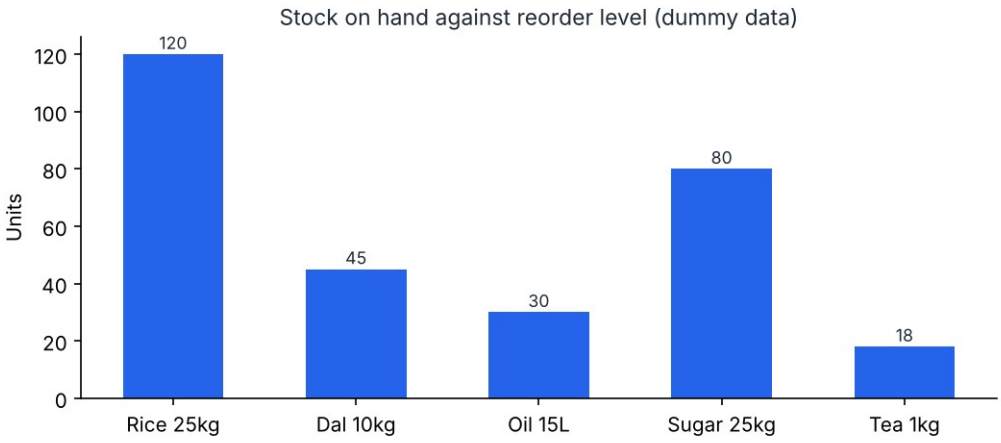

Figure 4: Stock on hand of five items (dummy data)

Worked example 2 - an order-to-cash transaction and its accounting. A customer, Kumar Stores, orders 20 bags of rice at Rs. 1,250 per bag. The sales order is Rs. 25,000, the GST at 5% is Rs. 1,250 and the invoice total is Rs. 26,250. The ERP creates the following entries automatically when the invoice is posted and when the customer pays.

Event	Document created	Account debited	Account credited	Amount (Rs.)
Invoice posted	Sales invoice	Accounts receivable - Kumar Stores	Sales revenue; GST payable	26,250 (25,000 + 1,250)
Stock issued	Delivery note	Cost of goods sold	Inventory (20 bags at cost Rs. 1,100)	22,000
Payment received	Receipt	Bank	Accounts receivable - Kumar Stores	26,250

The gross profit on the sale is Rs. 25,000 - Rs. 22,000 = Rs. 3,000, or 12% of sales. The example shows the main point of ERP: one sales entry updates sales, stock, tax and receivables together, and the same figures appear in every report.

Worked example 3 - a payslip. For a dummy employee with a basic salary of Rs. 20,000, house rent allowance of 40% of basic (Rs. 8,000) and a special allowance of Rs. 4,000, the gross salary is Rs. 32,000. The provident fund deduction of 12% of basic is Rs. 2,400 and the professional tax is Rs. 200, so the net salary is Rs. 32,000 - 2,400 - 200 = Rs. 29,400. The payroll module repeats this calculation for every employee and posts the total to the accounts.

10. Project: ERP Module Implementation & Process Study

Problem statement. Magadh Traders, a fictitious grocery wholesaler with a shop, a small warehouse and eight employees, keeps its sales in a bill book, its stock in a register and its accounts with an outside accountant. The owner cannot say quickly what stock is available, who owes money or what the month's profit is. The aim of the project was to study how an ERP system would handle the business and to map the processes onto its modules.

10.1 Scope and approach

- List the main business activities and group them by module: Sales, Procurement, Inventory, Finance and HR and Payroll.
- For each activity, identify the document created, the person responsible and the ERP module used.
- Prepare sample master data: five items, four customers, three vendors and four employees.
- Run one purchase cycle and one sales cycle with dummy figures and note the entries created.
- Prepare a month-end set of reports - stock summary, receivables list, trial balance and payroll summary - and read the dashboard.

10.2 Process-to-module map

Business activity	ERP module	Document created	Key control
Customer places an order	Sales	Quotation, sales order	Credit limit check
Goods are sent out	Inventory and Sales	Delivery note	Stock availability check
Customer is billed	Sales and Finance	Tax invoice (GST)	Correct tax rate and price
Money is received	Finance	Receipt	Matching to invoice
Stock runs low	Inventory	Purchase requisition	Reorder level
Goods are bought	Procurement	Purchase order, goods receipt	Three-way match
Vendor is paid	Finance	Payment voucher	Approval by a different person
Salary is paid	HR and Payroll	Payslip, payroll journal	Attendance and approval

10.3 Findings

The study showed that the owner's problems came from separate records and delayed entries. Stock was updated only at the end of the week, so the owner did not know when an item was about to run out; receivables were recorded in the bill book and were never totalled by customer, so late payers were not noticed; and payroll was calculated by hand with frequent small errors. In an ERP system, the stock would be updated at the moment of each sale, the receivables would be listed by age, and the payslips would be generated from attendance with the same rules for every employee.

10.4 Recommendations

- Start with Inventory, Sales and Finance, which give the quickest benefit, and add Payroll afterwards.

- Clean the master data before starting: one record per customer, vendor and item, with correct GST numbers and units.
- Train the staff and run the old and new systems together for one month before switching.
- Define who may create, approve and view each type of document.
- Review the dashboard every week - stock below reorder level, receivables over 30 days and the top five items by sales.

10.5 Expected benefits

With an ERP system, Magadh Traders could expect faster billing, fewer stock-outs and fewer cases of excess stock, better collection of money, accurate payroll and monthly accounts available within a few days rather than weeks. The cost of the software and training would be recovered through savings in time, reduced errors and better use of working capital.

11. Case Study Exercise: A Trading Firm Struggling with Mismatched Records

A fictitious pipe and hardware trading firm in Muzaffarpur has a sales team of five, a store and a small accounts office. Every month-end, the store's stock count does not match the accounts, the sales team promises items that are not available, and the accountant spends three days correcting entries. The owner has heard that an ERP system can help but fears that it will be expensive and difficult. The case was given to the student for analysis.

Analysis. The core problem is that the firm has three separate records - the sales register, the stock register and the accounts - and each is updated at a different time by a different person. There is no common master list of items, so the same item has different names in different records. There is also no rule about who approves what.

Proposed solution. Introduce a cloud-based ERP with Sales, Inventory and Finance modules, with a single item master with codes, stock updated automatically at the time of billing and goods receipt, and a few simple roles: sales entry, store keeper and accountant. The implementation would be done in stages: master data first, then opening balances, then a month of parallel running, and then full use.

Expected benefit and cautions. The month-end difference between stock and accounts would be reduced, the sales team would see the available stock while billing, and the accountant's time would be freed for analysis. The cautions noted were that the staff must be trained, that old data must be cleaned before it is moved, that the firm must not customise the system more than necessary, and that regular backups and access control must be in place.

12. Mock Practical Exercise: Tracing a Business Transaction Through the ERP Modules

A mock practical exercise was conducted at the end of the learning phase to check that the student could follow a business process through the modules independently. The task was to take one purchase and one sale of an item for a fictitious firm and show all the documents and entries. The steps followed were:

1. Master data: the item, a vendor and a customer were created with correct codes, units, GST numbers and prices.
2. Purchase requisition and purchase order: 50 units were ordered from the vendor at an agreed price.
3. Goods receipt: 48 units were received and the difference was noted; the stock ledger was updated.
4. Vendor invoice and three-way match: the order, receipt and invoice were compared and the quantity difference was resolved.
5. Payment: the vendor payment was recorded and the payable cleared.
6. Sales: a quotation, sales order, delivery and invoice for 30 units were prepared with GST.
7. Reports: the stock ledger, receivables list and trial balance were checked for consistency.
8. Presentation: the flow of one transaction through the modules was explained to the supervisor in about five minutes.

13. Sample Checklists Prepared

Master data checklist

- One record only for each customer, vendor, item and employee; no duplicates.
- Correct name, address, GST number, unit of measure and tax rate.
- New records approved by a second person before use.
- Inactive records are blocked, not deleted.

Month-end checklist

- All sales, purchase and stock transactions of the month are posted.
- Stock ledger agrees with the physical stock count.

- Receivables and payables lists are reviewed and reconciled with the ledgers.
- Bank reconciliation is done; payroll is posted; the period is locked.

14. Tools and Resources

The following tools and resources were used during the internship: a practice ERP environment and demonstration data, MS Excel for imitating ERP documents, ledgers and reports, MS Word and MS PowerPoint for notes and presentation, process maps and templates for master data, learning material on SAP, Tally Prime, ERPNext and Odoo, reference notes on GST and payroll rules, and regular mentor feedback.

15. Programme at a Glance

The programme was in the domain of Enterprise Resource Planning (ERP) with RKNEXORA PRIVATE LIMITED as the agency. It required a minimum of 120 hours over 28 learning days, organised in three phases: Orientation (Days 1-2), Learning and Practice (Days 3-22) and Project and Review (Days 23-28). Attendance was recorded in the Internship Attendance Log, signed by the supervisor (see Attendance Sheet).

The approximate distribution of the effort across the topics is shown below.

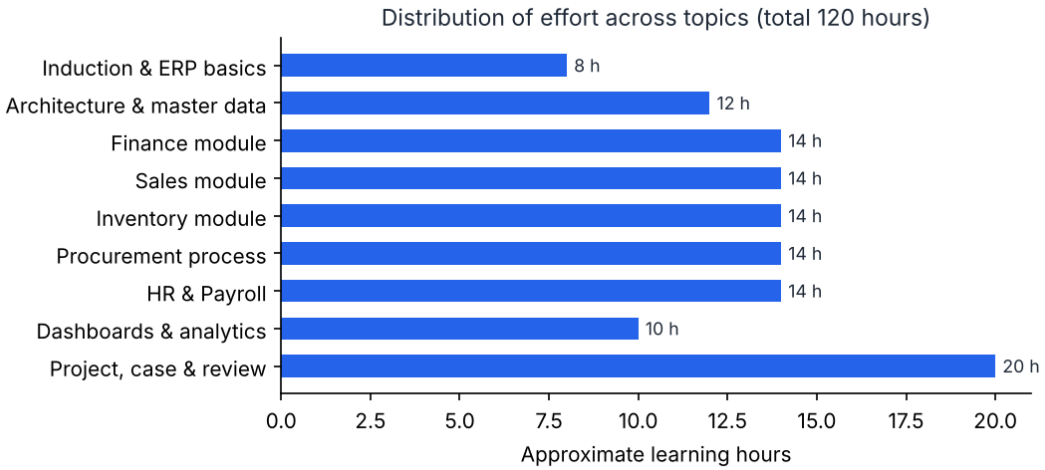

Figure 5: Distribution of learning effort across topics (120 hours)

LEARNING OUTCOME

a. Knowledge Acquired

1. The meaning of ERP, its benefits and challenges, and examples of ERP products used in India.
2. ERP architecture - user, application and database layers - and how modules share one database.
3. Master data and transaction data, and the importance of accurate master data.
4. The Finance module: chart of accounts, ledgers, journal entries, accounts payable and receivable, trial balance and financial statements.
5. The Sales module and the order-to-cash cycle with GST invoicing.
6. The Inventory module: item master, stock movement, stock ledger and reorder level.
7. The Procurement process, vendor evaluation and the three-way match.
8. HR and Payroll: salary structure, deductions, payslips and statutory contributions.
9. Dashboards and KPIs for reading business performance.

Glossary of Terms Learned

- **ERP** - Enterprise Resource Planning, integrated software for the whole business.
- **Module** - A part of the ERP for one function, such as Finance or Sales.
- **Master data** - Permanent records of customers, vendors, items and employees.
- **Transaction** - A business event recorded in the system, such as a sale.
- **Ledger** - A record of all entries of one account.
- **Journal entry** - A record with equal debit and credit.
- **Trial balance** - A list of ledger balances to check that debits equal credits.
- **Accounts receivable / payable** - Money to be received from customers / paid to vendors.
- **Order-to-cash** - The cycle from a customer's order to the receipt of money.
- **Procure-to-pay** - The cycle from a purchase requisition to the payment to the vendor.
- **Purchase order (PO)** - A document that orders goods from a vendor.
- **Goods receipt note (GRN)** - A record of goods received.
- **Three-way match** - Comparing PO, GRN and invoice before payment.
- **Reorder level** - The stock level at which a new order is placed.
- **Safety stock** - Extra stock kept to cover uncertainty.
- **GST** - Goods and Services Tax charged on supply of goods and services.
- **Payslip** - A statement of earnings and deductions of an employee.
- **KPI / Dashboard** - Key performance indicator / a screen that shows KPIs.
- **Audit trail** - A record of who did what in the system and when.

b. Skills Learned

Technical skills. Creating and checking master data; posting journal entries and reading ledgers and trial balances; preparing quotations, sales orders and invoices; recording goods receipts and stock movements; calculating reorder levels; preparing payslips; mapping business processes to ERP modules; and reading dashboards and reports, with MS Excel used to practise and check calculations.

Professional skills. Process thinking and attention to detail; analytical and logical thinking; accuracy with numbers; understanding of controls and responsibility; teamwork across departments; clear documentation; and presenting a process in simple words.

These skills were developed through repeated practice and daily documentation. Following one transaction through several modules built an understanding of how departments depend on one another, checking figures between reports built accuracy, and explaining the process to the supervisor built clarity of communication.

c. Observed Attitude and Gained Values

1. **Accuracy and integrity:** every figure entered becomes part of other reports, so careful and honest entry is essential.
2. **Accountability:** each document shows who prepared and approved it, and responsibility cannot be avoided.
3. **Confidentiality:** salary and customer data were treated as confidential and only dummy data was used.
4. **Process discipline:** following the defined process instead of shortcuts keeps the data reliable.
5. **Discipline and punctuality:** regular reporting at fixed timings and daily attendance records.

d. Challenges Faced

Understanding the many documents and their sequence was handled by drawing the process flows and tracing one transaction at a time.

Understanding debit and credit entries behind each transaction was handled by writing the entry for every document and checking that the trial balance agreed.

Seeing why stock figures differed from the register was handled by following the stock ledger transaction by transaction.

Calculating payroll with several deductions was handled by preparing a step-by-step template and checking the totals.

Remembering the different modules and terms was handled by making a glossary and a process-to-module map.

Managing time between practice, documentation and report writing was handled by dividing work week by week and using review days for corrections.

e. Career Pathways

The knowledge gained supports careers such as ERP Functional Consultant (junior), ERP Support Executive, Business Analyst, Accounts and Finance Executive, Inventory and Stores Executive, Procurement Executive, Payroll and HR Operations Executive and Supply Chain Executive. Opportunities exist in manufacturing and trading companies, retail chains, IT consulting firms, banks and start-ups. Related higher-study options include MBA or PGDM in operations, finance or information systems, M.Com, MCA and professional courses in accounting and ERP products such as SAP and Tally. A good next step is to learn one ERP product in depth, learn Excel and SQL for reports, and take a certification in the chosen module.

CONCLUSION

The internship in Enterprise Resource Planning (ERP) was a valuable learning experience that integrated academic knowledge with practical activity. The programme achieved its objectives through structured learning, guided practice, assignments, supervisor review and documentation.

The student gained a clear understanding of how an ERP system integrates the work of a business - through its architecture, master data, Finance, Sales, Inventory, Procurement and HR and Payroll modules and dashboards - and acquired practical familiarity with documents, entries, stock calculations and payroll. The experience has strengthened the student's employability and provides a foundation for further study and work in ERP, accounting, supply chain and business analysis.

Reflection

Looking back, the most useful lesson of the internship was that an ERP system is not just software but a way of working in which every department depends on the accuracy of the others. A wrong item code at the store showed up as a wrong figure in the accounts; a delay in entering a delivery meant a wrong stock figure for the sales team. Following a single transaction from the purchase order to the payment, and from the quotation to the receipt, made the connection between the modules clear, and the habit of checking figures between reports built a respect for accuracy.

Objectives and Achievement

The objective of understanding ERP architecture and master data was achieved through the architecture figure and the master data checklist. The objective of learning the Finance, Sales and Inventory modules was achieved through the journal entries, the invoice and accounting example and the reorder level calculation. The objective of learning Procurement and HR and Payroll was achieved through the three-way match and the payslip example. The objective of reading dashboards and mapping a process was achieved through the process-to-module map and the Magadh Traders study.

Future Scope

The knowledge gained can support further study of information systems, accounting and supply chain, and careers in ERP implementation and support. With the growth of GST-based digital billing, cloud accounting and formal business in Bihar and across India, more small and medium businesses are moving to ERP systems, and people who understand both the business process and the software are increasingly needed.

Suggestions for Improvement of the Programme

1. Provide access to a full ERP demonstration environment for each student.
2. Include a short module on report writing and dashboards using MS Excel and a BI tool.
3. Add a group exercise on implementing an ERP system in a small business, including data migration.
4. Continue regular mentor feedback and progress reviews.
5. Encourage students to maintain detailed daily documentation.
